

Supplementary materials

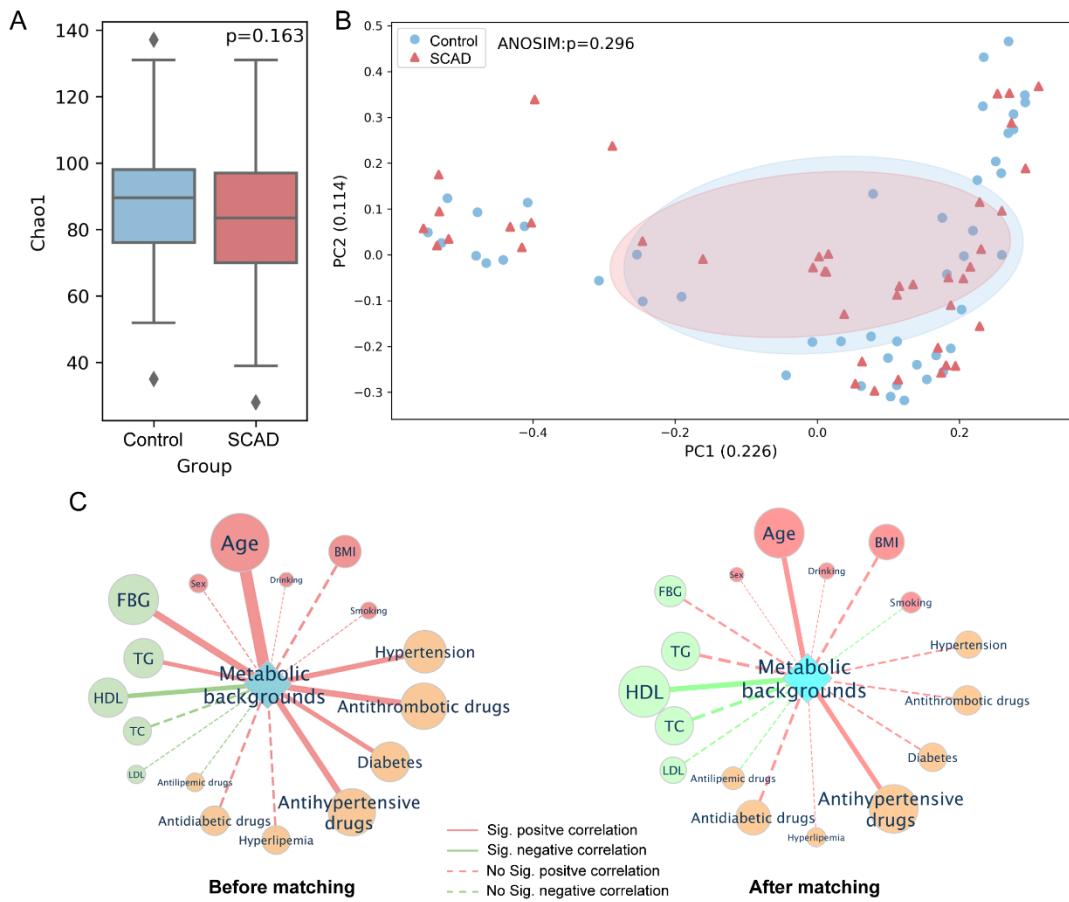

Figure S1 Individual differences confuse the differences between HCs and SCAD patients. (A) Alpha-diversity, beta-diversity of gut microbiome showed no alteration between HCs and SCAD patients before PSM. Wilcoxon rank-sum test and Analysis of Similarities (ANOSIM) was used to determine the significance. (C) Correlation of demographics and clinical characteristics with metabolic background before and after PSM. The size of circles and thickness of links indicated the r value of Spearman correlation.

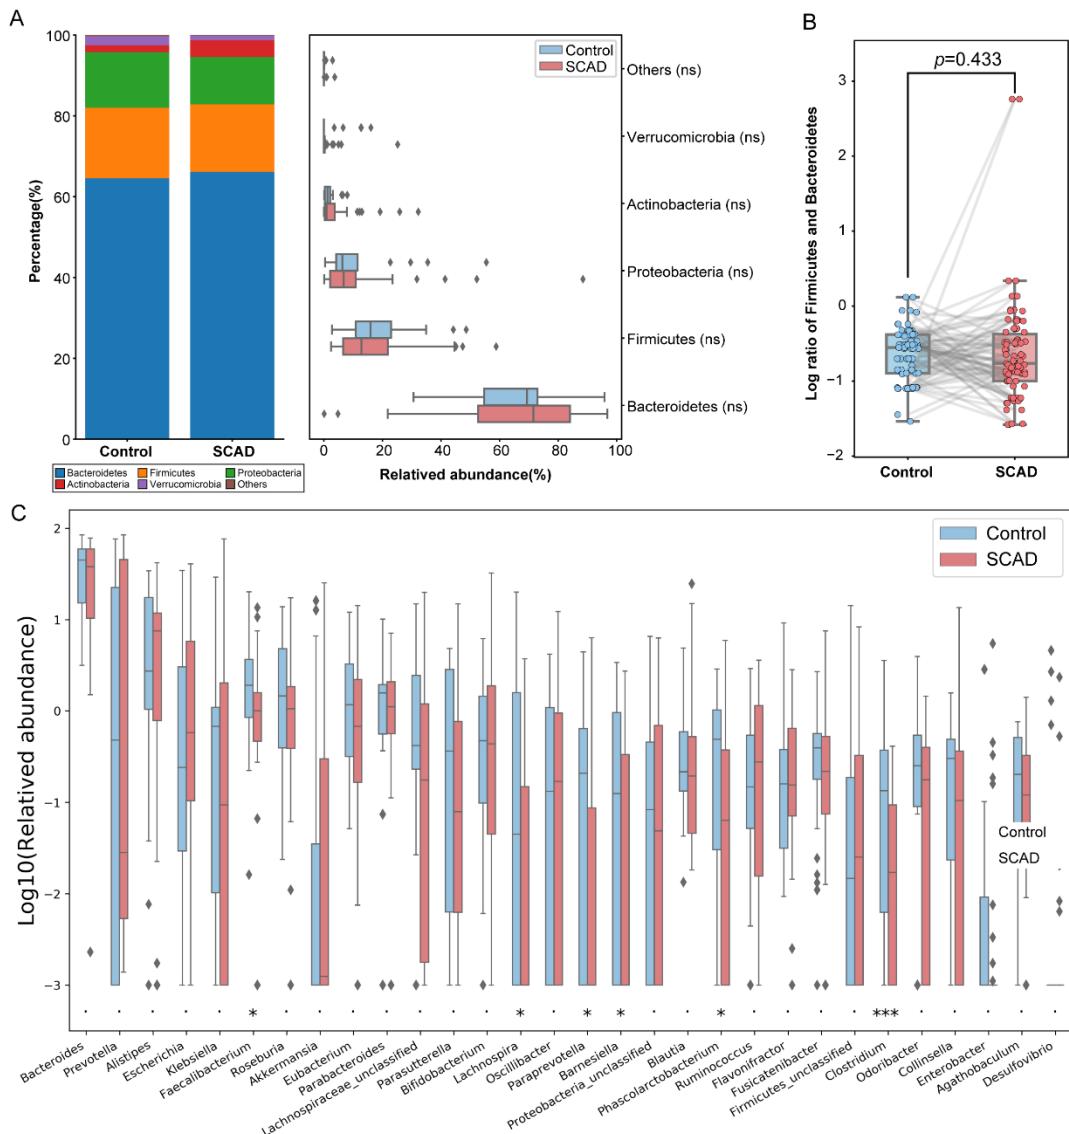

Figure S2 Gut microbiome variations at the phylum and genus level in the cohort. (A) The proportion and relative abundance of the five most abundant phylum in the two groups. (B) The ratio of *Bacteroidetes* to *Firmicutes* between the two groups. (C) The relative abundance of the thirty most abundant genera in the two groups. Wilcoxon signed-rank test was used to determine the significance. * $P<0.05$, *** $P<0.001$.

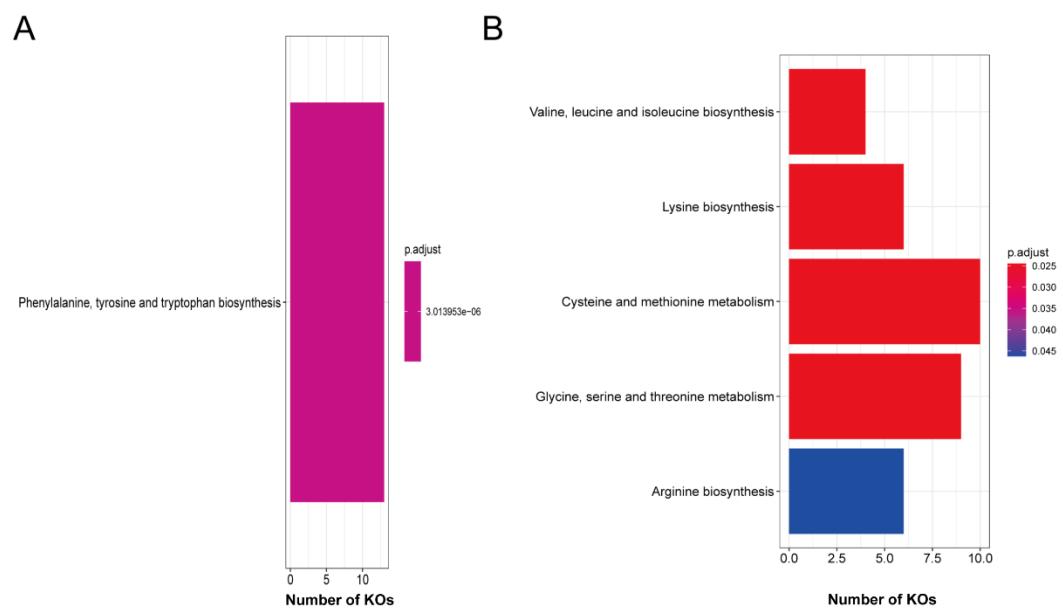

Figure S3 The different amino acid metabolic pathways enriched by up-regulated (A) and down-regulated (B) KOs in SCAD.

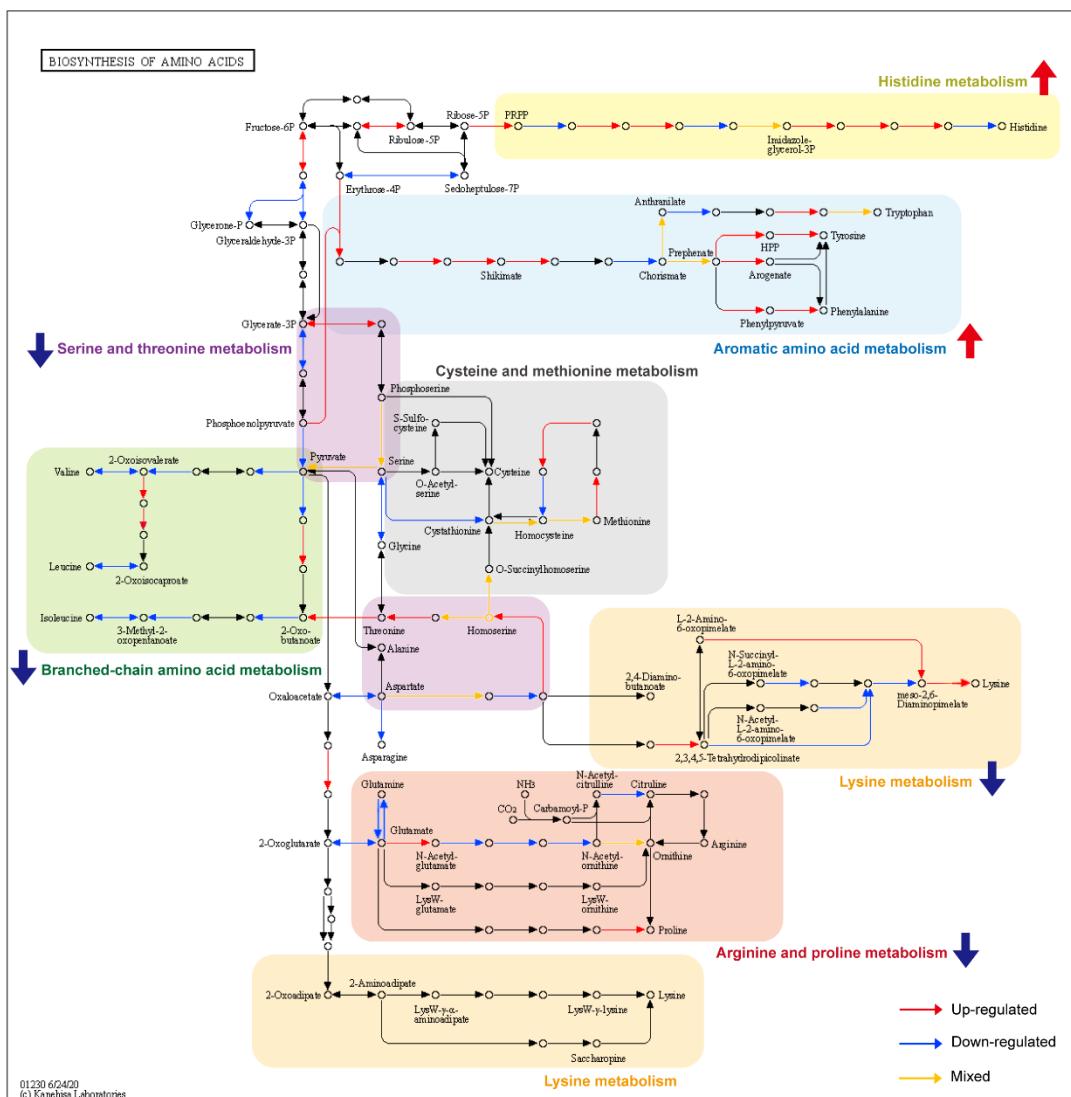

Figure S4 Key amino acid metabolic pathways mapped by microbial differential KO genes.
The pathways were generated on the basis of KEGG pathway maps. Blue arrows represent down-regulated KOs or pathways, red arrows represent up-regulated KOs or pathways, yellow arrows indicate the trend is unclear, which mixed up and down regulated KOs in SCAD patients.

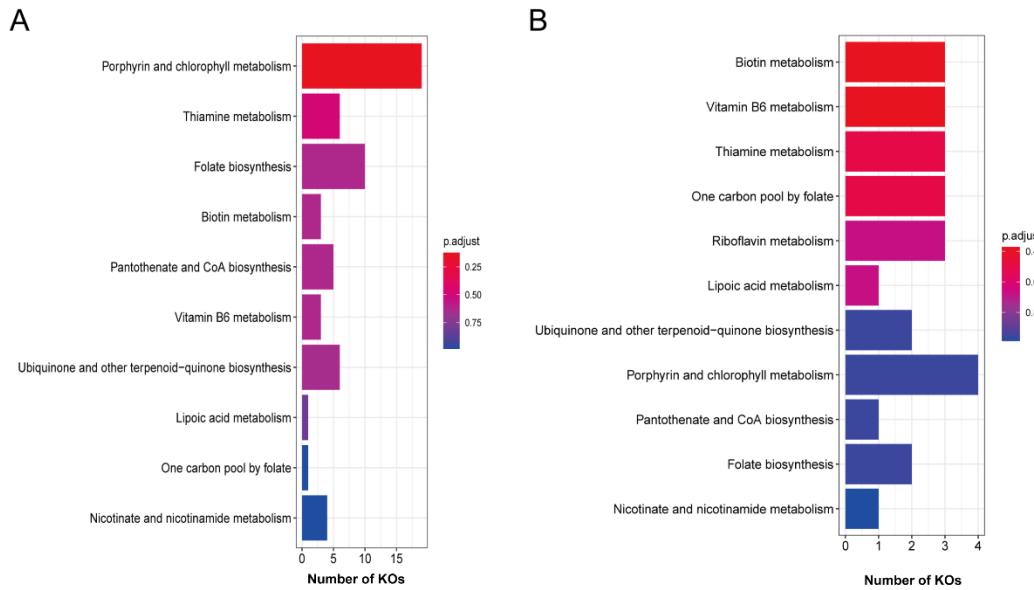

Figure S5 The different cofactor metabolic pathways enriched by up-regulated (A) and down-regulated (B) KOs in SCAD.

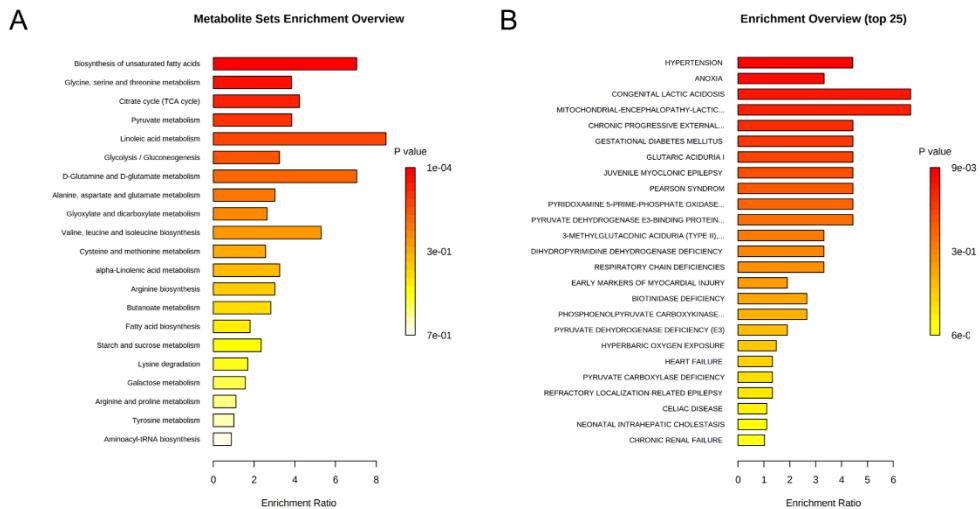

Figure S6 The metabolic pathway (A) and the human disease (B) enrichment analysis of differential serum metabolites in SCAD by MetaboAnalyst.

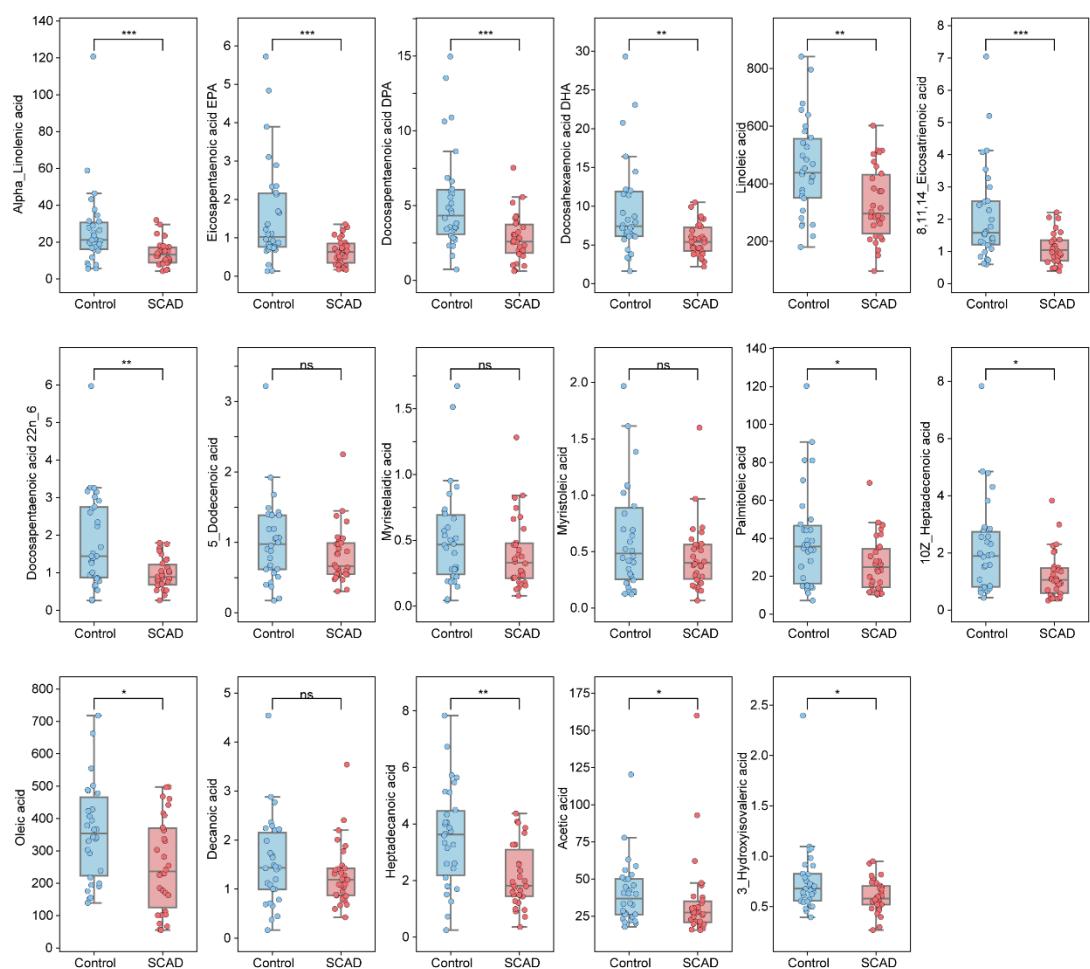

Figure S7 The relative abundances of unsaturated fatty acid between SCAD patients (n=30) and HCs (n=30) in an independent cohort. Wilcoxon ranksum test was used to determine the significance. * $P<0.05$, ** $P<0.01$ *** $P<0.001$.

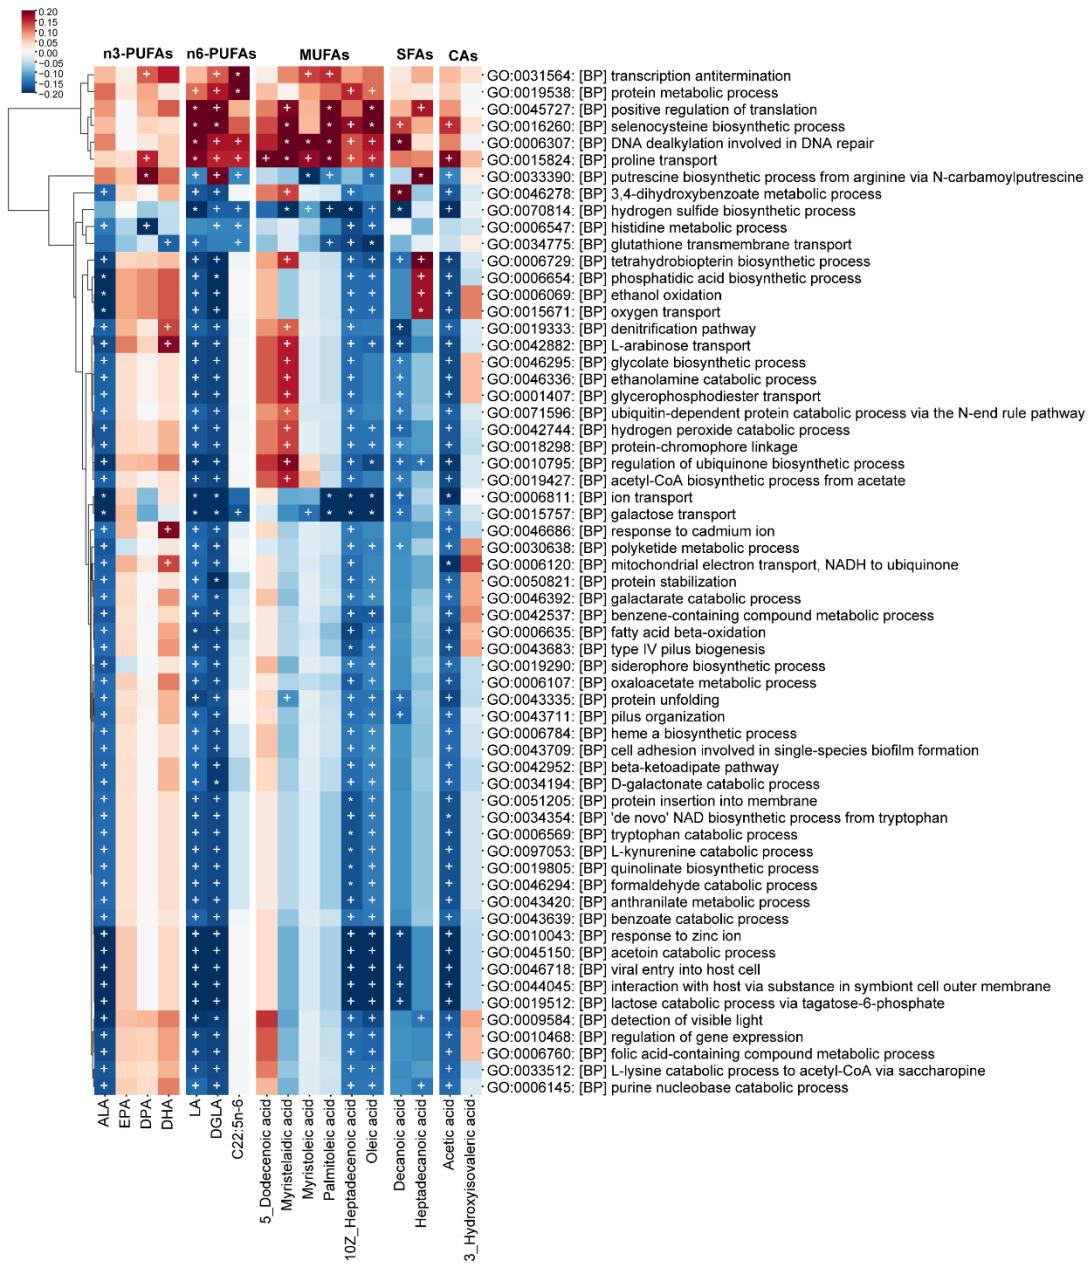

Figure S8 The key GO terms (biological process) correlated to fatty acids. The signs of change trend for each paired samples in cohort were calculated, and then normalized mutual information score was used to evaluate the association of change trends. Normalized mutual information score ranges from 0 to 1, indicating that the association between the two trends ranges from weak to strong. The sign of score was evaluated by the direction consistency of two trends. Permutation test (1000 permutations) was performed to determine p-value of correlation and GO term significant correlated to >5 fatty acids was selected for display. * and * suggest the significance, * P<0.05, * P<0.01.

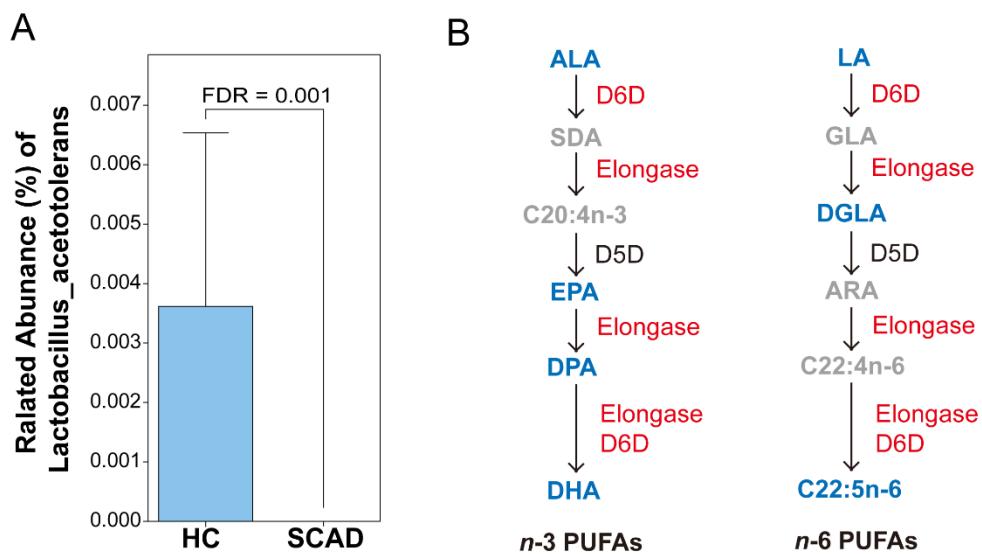

Figure S9 The abundance of microbial species and enzyme for metabolizing unsaturated fatty acid in SCAD. (A) Relative abundance of *Lactobacillus acetotolerans* between the two groups. Wilcoxon signed-rank test, $P_{\text{FDR}} < 0.001$. (B) Metabolism of alpha-linolenic acid (ALA) and alpha-linoleic acid (LA) by gut microbes. Blue represents the unsaturated fatty acids decreased significantly in SCAD patients. Red represents the relative abundance of metabolic enzyme for unsaturated fatty acids increased significantly in SCAD. SDA: Stearidonic acid; EPA: Eicosapentaenoic acid; DPA: Docosapentaenoic acid; DHA: Docosahexaenoic acid; GLA: Gamma-linolenic acid; DGLA: Dihomo-gamma-linolenic acid; ARA: Arachidonic acid; D6D: Delta-6 desaturase, D5D: Delta-5 desaturase.
