Table S4 Shapiro-Wilk Normality Data

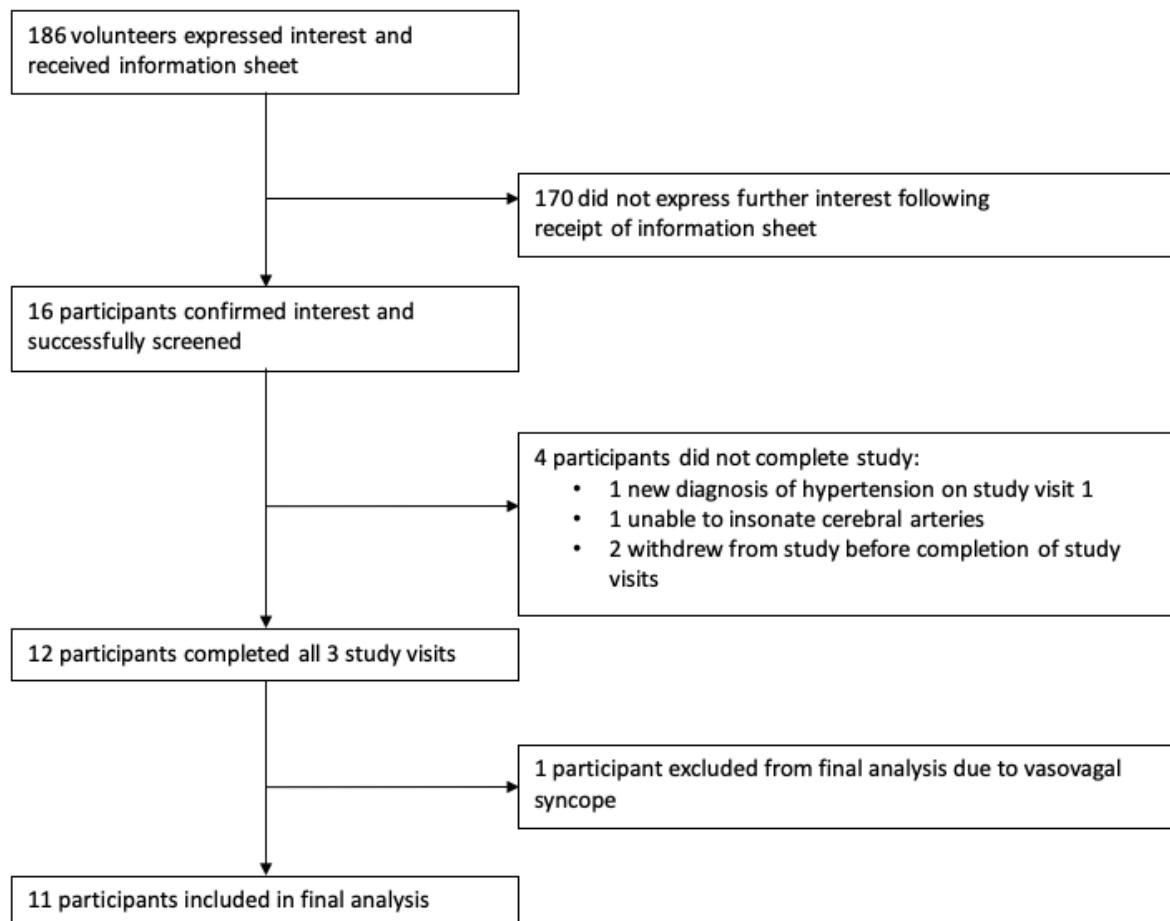

Figure S1. Study Participation

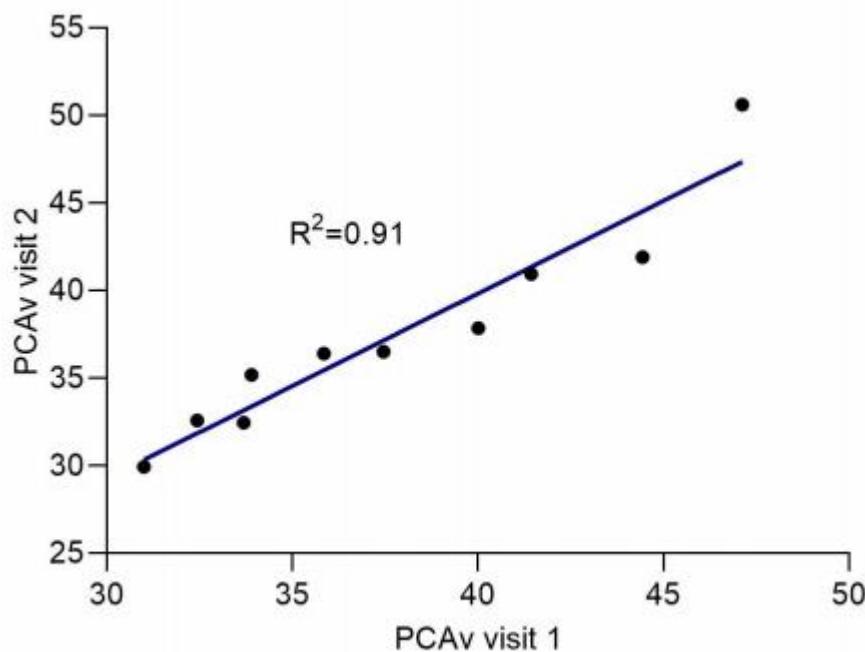

Figure S2. Test-retest reliability

Here we show our test-retest reliability for baseline PCA velocity values taken from 10 participants tested on 2 separate days, a minimum of 1 week apart. The evaluation of test-retest reliability using an intraclass correlation coefficient (ICC) is the preferred metric of use.⁴⁹ We report an ICC score of 0.951.

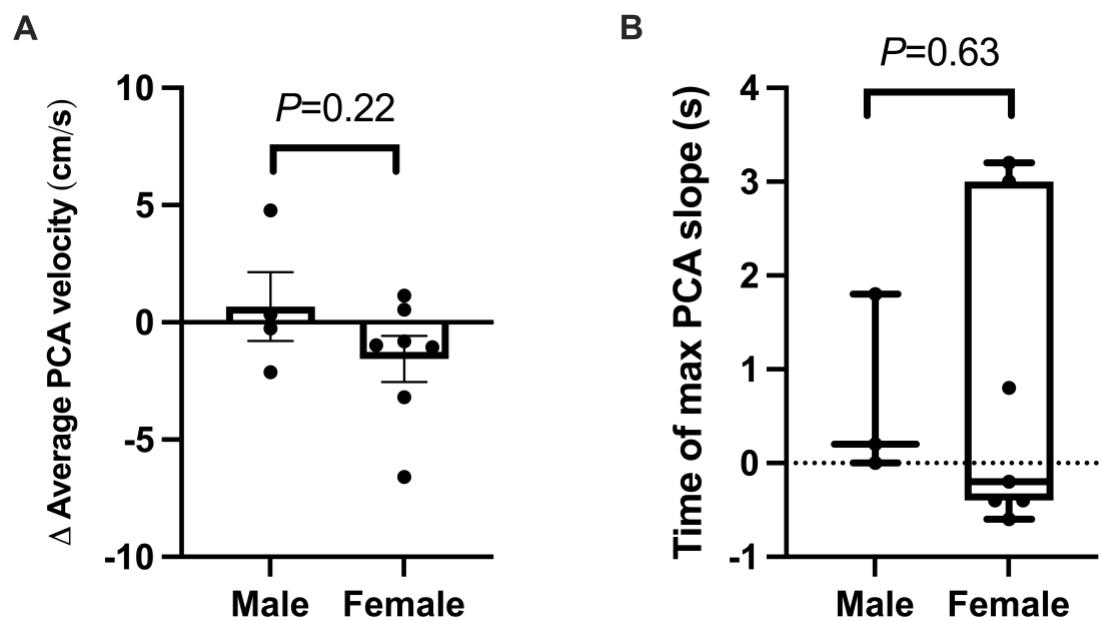

Figure S3. Analysis of sex-based differences in PCA responses to SMTc, as analysed by unpaired t test (panel A, mean \pm SEM) or Mann-Whitney test (panel B, median (IQR)). n=11 for panel A (4 male, 7 female), n=10 for panel B (3 male, 7 female).

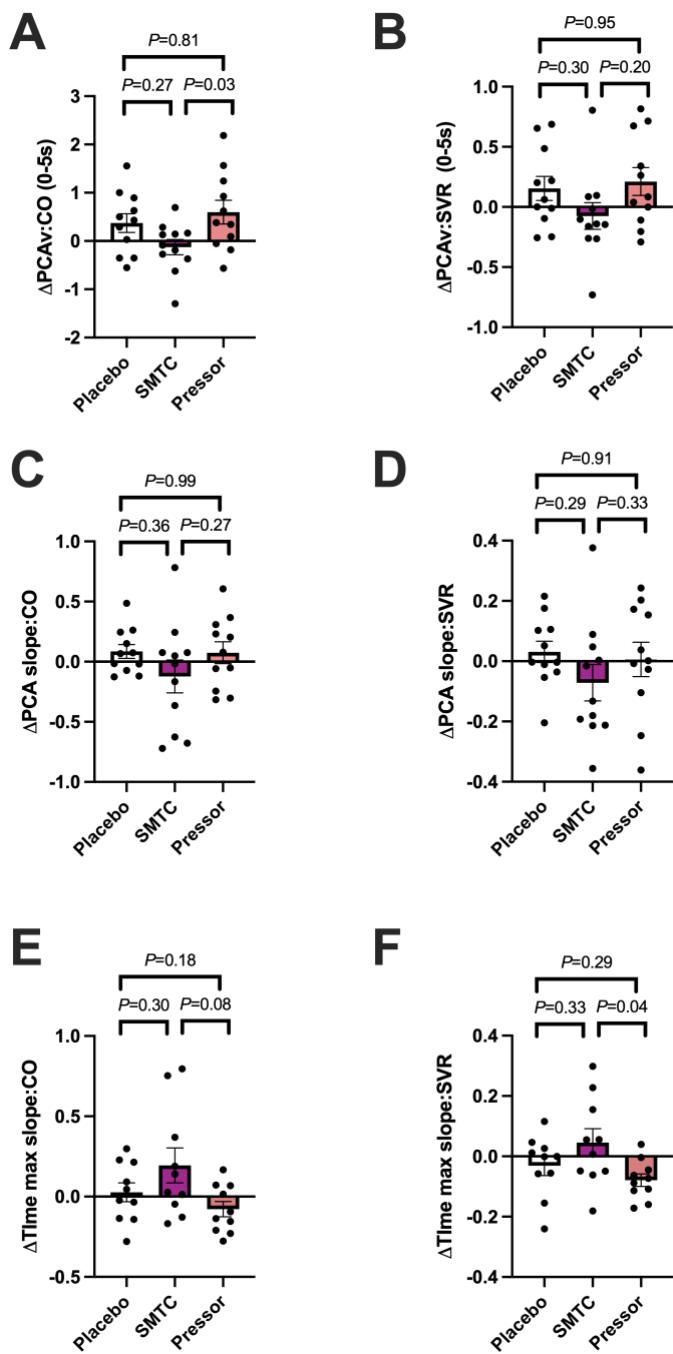

Figure S4. Changes in neurovascular coupling velocity corrected for changes in haemodynamic conditions. Panels A, C, E show indices corrected for CO. Panels B, D, F show indices corrected for SVR. Analysis performed using one way ANOVA and Tukey *post hoc*. Data presented as mean \pm SEM. n=11, apart from panels E&F (n=10).
