

Supplementary Information

Tab. S1. Mean values \pm SE (n=7) of chlorophyll *a* fluorescence kinetic parameters (F_v/F_m , Area, PI, ABS/CS_m, TR_o/CS_m, ET_o/CS_m, DI_o/CS_m, RC/CS_m) in glaucous (GL) and non-glaucous (N-GL) near-isogenic lines (NILs) of rye under control (C) and drought (D) conditions. The statistically significant differences between the means in control and drought were verified for $P \leq 0.001$ (***), $P \leq 0.01$ (**), $P \leq 0.05$ (*) according to Student's test. ns, not significant. SE, standard error. *T*, treatment; F_v/F_m , the maximum photochemical efficiency of photosystem II (PSII); Area, the size of the electron acceptor field of PSII; PI, the overall performance index of PSII; ABS/CS_m, the photon flux absorbed by antenna dye molecules; TR_o/CS_m, the excitation energy trapped in PSII reaction centers; ET_o/CS_m, the electron transport rate by PSII; DI_o/CS_m, the energy dissipated from PSII; RC/CS_m, the density of active reaction centers.

Tab. S2. Drought resistance indices in glaucous (GL) and non-glaucous (N-GL) near-isogenic lines (NILs) of rye, that is, the drought to control percentage ratio (D/C_{GW} and D/C_{TGW}) and the drought susceptibility index (DSI_{GW} and DSI_{TGW}) calculated based on grain weight (GW) and thousand grain weight (TGW), and indices calculated based on grain weight, that is, tolerance index (TOL), Mean Productivity (MP), Harmonic Mean (HM), Geometric Mean Productivity (GMP), Yield Index (YI), Sensitivity Drought Index (SDI), Yield Stability Index (YSI).
