

**Figure S6.**

HMGA2-knockdown effects on EMT marker gene expression. **A** and **B**, The mRNA levels of each gene were determined by qPCR in JHH-4 cells treated with siRNA for HMGA2 for 72 h (**A**) or in HMGA2-expressing HepG2 and HuH-7 cells (**B**). The values normalized with those of TBP (JHH-4), GAPDH (HepG2), and RNA18SN2 (HuH-7) are shown relative to the control (Ctr; JHH-4, Mock; HepG2 and HuH-7). The values represent the mean \pm SD from triplicates.
