

Figure S1: Ipsilateral RGC neurogenesis is prominent in the ventral CMZ in pigmented mice but reduced in the albino, Related to Figure 1

A, B, E, F) Number of tdTomato⁺ (A), tdTomato⁺/Islet1⁺ (B), tdTomato⁺/Zic2⁺ (E) and tdTomato⁺/Brn3a⁺ (F) cells in a full series of 12μ m sections collected along the rostro-caudal head axis (nasal, rostral; temporal, caudal). Each point corresponds to an individual section, plotted on the x-axis as a function of distance (in μ m) from the first section in the series that contained the optic nerve head opening.

C) Immunostaining of tdTomato, AP-2 α (top), Otx2 (middle) and Prox1 (bottom) in the pigmented and albino ventrotemporal retina at E17.5. Co-labeling of tdTomato with either AP-2 α , Otx2, or Prox1 is rare in the ventrotemporal retina. Scale bar: 100 μ m.

D) Quantification of tdTomato⁺/Islet1⁺ (RGC), tdTomato⁺/AP- $2\alpha^+$ (amacrine), tdTomato⁺/Otx2⁺ (cone and bipolar), and tdTomato⁺/Prox1⁺ (horizontal) cells in the ventrotemporal retina of pigmented and albino mice at E17.5.

G) Quantification of tdTomato⁺/Brn3a⁺ cells in the ventrotemporal retina of pigmented and albino mice at E17.5.

H) Quantification of the proportion (% of total) of Brn3a⁺ cells deriving from the CMZ.

I) Quantification of tdTomato⁺/Zic2⁺ and tdTomato⁺/Brn3a⁺ cells as a percentage of the total CMZderived RGCs (tdTomato⁺/Islet1⁺).

J-L) Quantification of tdTomato⁺ (J), tdTomato⁺/Islet1⁺ (K), tdTomato⁺/Brn3a⁺ (L) cells in the nasal and temporal dorsal retina of pigmented and albino mice at E17.5. Very few retinal cells originate from the dorsal CMZ.

M) Quantification of apoptotic (TUNEL⁺) cells within the pigmented and albino ventrotemporal CMZ at E13.5 and E14.5.

Figure S2: scRNA-Seq in the pigmented and albino CMZ, Related to Figure 2

Identification of single-cell clusters by known cell type-specific markers.

A) CMZ cells express *Wfdc1*, *Ccnd2*, *Msx1* and *Gja1*. Early RPCs express *Sfrp2*, *Hes1* and *Ccnd1* while late RPCs express *Fgf15*. Neurogenic cells express *Atoh7* and *Hes6*. RGCs express *Isl1* and *Pou4f1*. The HC/AC cluster expresses *Ptf1a*, *Lhx1*, and *Onecut1/2*. PR precursors express *Otx1*, *Neurod1* and *Neurod4*, and cones express *Crx*.

B) RPC cells were enriched in *Hist1h2ap* and *Hist1h2ae*, marking the S and M cell cycle phases, as well as in *Cenpf*, *Ube2c* and *Prc1* marking the M phase.

C) Violin plots showing comparison of genes that define RPC clusters between pigmented and albino.

Figure S3: scRNA-Seq in the pigmented and albino CMZ, Related to Figure 2

A) RNA Velocity vector fields projected on UMAP of single-cell clusters in the pigmented and albino datasets.

B) Differentially expressed genes (DEG) between pigmented and albino, included in the GO term "cell proliferation" across single-cell clusters. Size of the dot represents percentage of cells within a class, while color represents average expression level across all cells within a class.

C-D) Violin plots showing comparison of genes associated with ipsilateral (C) and contralateral (D) fate.

E-F) Validation of Zic2 (E-F) and Igfbp5 (G-H) downregulation with immunohistochemistry and RNAscope, respectively. Scale bar: 25µm.

Figure S4

Figure S4: CyclinD2-dependent G1/S transition regulates ipsilateral RGC neurogenesis, Related to Figure 4

A) Example immunostaining of CyclinD2 in the CyclinD2^{WT} and CyclinD2^{cKO} ventrotemporal CMZ (area in the box) at E14.5. CyclinD2 is conditionally deleted from the CyclinD2^{cKO} CMZ, whereas it is still expressed in the lens and optic nerve head (arrows).

B) Schema of the dual-pulse birthdating experiment.

C-D) Quantification of cells in the G1 and S phases of the cell cycle at E14.5. Het mice: α Cre; CyclinD2^{flox/+}.

E-F) Immunostaining (E) and quantification (F) of the mitotic marker PH3 in the CyclinD2^{WT} and CyclinD2^{cKO} ventrotemporal CMZ (area in the box) at E14.5. Scale bar: 100μ m.

G) Quantification of apoptotic (TUNEL⁺) cells within the CyclinD2^{WT} and CyclinD2^{cKO} ventrotemporal CMZ at E14.5.

H) Quantification of Zic2⁺ and Brn3a⁺ cells in the CyclinD2^{WT} and CyclinD2^{cKO} ventrotemporal retina at E15.5, E17.5 and P1.

I-J) Immunostaining (I) and quantification (J) of AP-2 α (left), Otx2 (middle) and Prox1 (right) in the CyclinD2^{WT} and CyclinD2^{cKO} peripheral ventrotemporal retina at E17.5. Dashed red lines in (I) indicate the 150 μ m-long peripheral retina segment analyzed. Scale bar: 50 μ m.

Figure S5: Depth perception requires CyclinD2 expression in the CMZ, Related to Figure 5

A-B) Depth perception, corresponding to the percentage of trials in which the shallow side was chosen by each mouse across all trials in the visual cliff task, comparing pigmented and albino mice (A) and CyclinD2^{WT} and CyclinD2^{cKO} mice (B).

C) Schema of the Optodrum setup, used to measure contrast sensitivity and visual acuity.

D-E) Quantification of contrast sensitivity (D) and visual acuity (E) of CyclinD2^{WT} and CyclinD2^{cKO} mice.

Figure S6: CyclinD2 upregulation restores binocular circuit formation and function in albino mice, Related to Figure 6

A-B) Violin plots and RNA scope quantification (fluorescent puncta per nucleus) of *Fos* and *Jun* in the CMZ, showing their downregulation in the albino dataset.

C) Violin plots of *Cacna1* genes in the pigmented and albino scRNA-Seq clusters.

D) Immunostaining of Ca_V1.3 and Msx1 in the pigmented and albino ventrotemporal CMZ, showing Ca_V1.3 expression within the Msx1⁺ domain. Panels on the right correspond to the areas in the box (left) in magnification. Scale bar: $100 \mu m$.

E, G) Fluorescent in situ hybridization (RNA scope) of *Fos* (E) and *Jun* (G) in the CMZ of albino Sham vs BayK treated mice at E14.5.

F, H) Quantification of *Fos* (F) and *Jun* (H) in the CMZ of pigmented and albino Sham vs BayK treated mice at E14.5. *Fos* and *Jun* expression are quantified as number of fluorescent puncta per nucleus. Scale bar: 25µm.

Figure S7

Figure S7: CyclinD2 upregulation restores binocular circuit formation and function in albino mice, Related to Figure 6

A) Immunostaining of Ki67, BrdU, and EdU in the ventrotemporal CMZ (area in the box) of albino Sham vs BayK treated mice at E14.5. Scale bar: 100µm.

B-C) Quantification of cells in the G1 (B) and S (C) phases of the cell cycle at E14.5.

D) Immunostaining of the mitotic marker PH3 in the ventrotemporal CMZ (area in the box) of albino Sham vs BayK treated mice at E14.5. Scale bar: 100μ m.

E) Quantification of cells in the M phase of the cell cycle (PH3⁺) at E14.5.

F) Quantification of apoptotic (TUNEL⁺) cells within the Zic2⁺ domain of the ventrotemporal CMZ at E14.5.

G) Immunostaining of CyclinD2 and Zic2 in the CyclinD2^{WT} and CyclinD2^{cKO}, BayK-treated ventrotemporal retina and CMZ (area in the box) at E15.5. Scale bar: $100 \mu m$.

H) Quantification of $Zic2^+$ cells at E15.5.

I) Quantification of depth perception, corresponding to the percentage of trials in which the shallow side was chosen, comparing CyclinD2^{WT} and CyclinD2^{cKO} Sham vs BayK treated mice.
