Table S4. Protein complexes added to the database.

Complex name	Protein	Function	Target (modification)	Comment
MSL histone acetyltransferase complex	MSL1, MSL2, MSL3, KAT8 (hMOF)	histone acetylation complex	Histone H4 (H4K16Ac)	Responsible for genome-wide H4K16 acetylation. Affects chromatin organization and regulates transcription. Involved in regulation of cell cycle progression, DNA damage repair and apoptosis.
WMM (WTAP-METTL3-METTL14) methyltransferase complex	METTL3, METTL14, WTAP, ZC3H13, CBLL1, VIRMA	RNA methylation	Adenosines of RNA and DNA (m6A)	Regulates processes dependent on RNA stability as m6A methylation leads to RNA degradation. Controls cell differentiation of embryonic and hematopoietic stem cells by destabilization of transcripts. Involved in response to DNA-damage. Mediates random X-inactivation by methylation of Xist-RNA. Marks primary microRNAs for processing. Promotes translation.
Mis18	MIS18A, OIP5, MIS18BP1	Chromatin remodeling	Histone variant CENPA	Regulates CENPA recruitment to centromeres and thereby normal chromosome segregation during mitosis. Interacts with DNMT3A/3B and provides its centromeric localization regulating epigenetic states of centromeric chromatin. Provides access of CENPA-specific chaperone HJURP to centromeres.
CUL4-DDB-ROC1 (CUL4-DDB-RBX1)	DDB2, DDB1, RBX1, CUL4B, CUL4A	Histone ubiquitination complex	Histones	Recognises UV-induced cyclobutane pyrimidine dimers in chromatin and ubiquitinates histones and other chromatin-associated proteins located around the DNA lesion. Promotes the removal of ubiquitinated histones from the nucleosome and subsequent DNA repair.
