

Supplementary Table 7. Decision curve analysis and number needed to treat/harm in comparison to treating only patients with high-risk varices

Treatment threshold	Number needed to treat/harm*		
	Definite CSPH strategy	Probable CSPH-based strategy	Treat all varices-based strategy
5%	27	-139	38
10%	50	-66	115

CSPH, clinically significant portal hypertension.

*Number needed to treat/ harm are defined with respect to the endoscopy-based strategy of treating only patients with high-risk varices. The negative number needed to treat indicates the number needed to harm.
