Title: Chromosome size matters: genome evolution in the cyperid clade

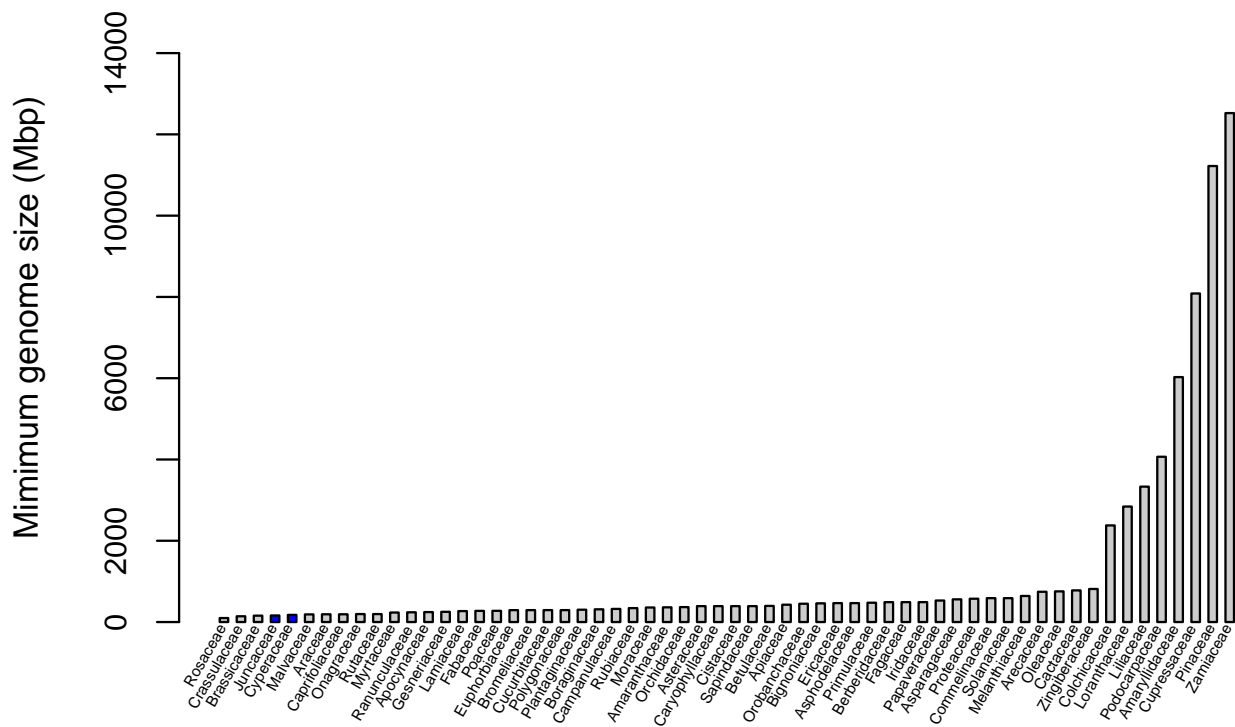

FIG. S11. Minimum holoploid genome sizes (Mbp) across 60 families of seed plants. Data were compiled from our study (Cyperaceae and Juncaceae: shown in blue) and from the Plant DNA C-values database (Pellicer and Leitch, 2020) for the other 58 families. Only families with at least 20 observations from five different genera were included in the figure, which omitted the family Lentibulariaceae among others.
