

Supplementary Figure S2: Forest plot comparing basal vs. non-basal subtype as defined by PAM50 or by IHC, and their associations with disease free survival on capecitabine vs. observation arm. Hazard ratios, 95% confidence intervals and *P*-values are derived from Cox regression multivariate analysis adjusted for age, menopausal status, histological grade, tumor size, stage, breast surgery, region, nodal status, and chemotherapy regimen. The displayed *P*-interaction indicates results of test of heterogeneity. Results were adjusted for multiplicity testing using the Benjamini-Hochberg method (BH).

Supplementary Figure S2
