

Supplemental Material S2. The trajectory of speech recognition development for the second implanted ears of children with sequential bilateral implantation. Panel A shows the trajectories with the age at activations as vertical lines. Panel B shows the trajectories shifted to the age at cochlear implant activations, as well as the average growth curve shown in thickened, royal blue line with a shaded area around the average scores (light blue), representing ± 1 standard deviation around the average values. Different colors are used for showing the data for different ears.
