

## Supplementary information

# Measurement of the axial vector form factor from antineutrino–proton scattering

In the format provided by the  
authors and unedited

## Supplementary Material.

**Supplementary Table 1 Measured events and predicted backgrounds.** Measured events, post-fit Monte Carlo background prediction, measured signal, and the statistical uncertainties after background subtraction, in each  $Q^2$  bin. Only bins 3-17 are statistically significant and reported in the cross-section.

Bin	$Q^2_{\text{low}}$	$Q^2_{\text{up}}$	Measured Event	Pred. BG	Signal	Stat. Err
1	0	0.00625	0	0	0	-

**Supplementary Table 2 Protons on Target (POT) and Number of Hydrogen Atoms in the Fiducial Volume of the Detector.**

POT	1.12e+21
Number of Hydrogen Atoms	2.61e+29

**Supplementary Table 3 Measured and fitted cross-sections.** Binned cross-section ( $10^{-38}$ ) with the statistical and systematic uncertainties. The predicted cross-section using the z-expansion fit with different combinations of ( $k_{\max}$ ,  $\lambda$ ) are shown after the data column, with the total uncertainty shown in the bracket.

Bin	$Q_{\text{low}}^2$	$Q_{\text{up}}^2$	$d\sigma/dQ^2(10^{-38})$	stat.	sys.	Fit(8, 0.13)	Fit(6, 0)
