The lowest average pixel intensity of each analyte across experimental conditions is defined as 0 %. The highest pixel intensity in each data set was set as 100 %.

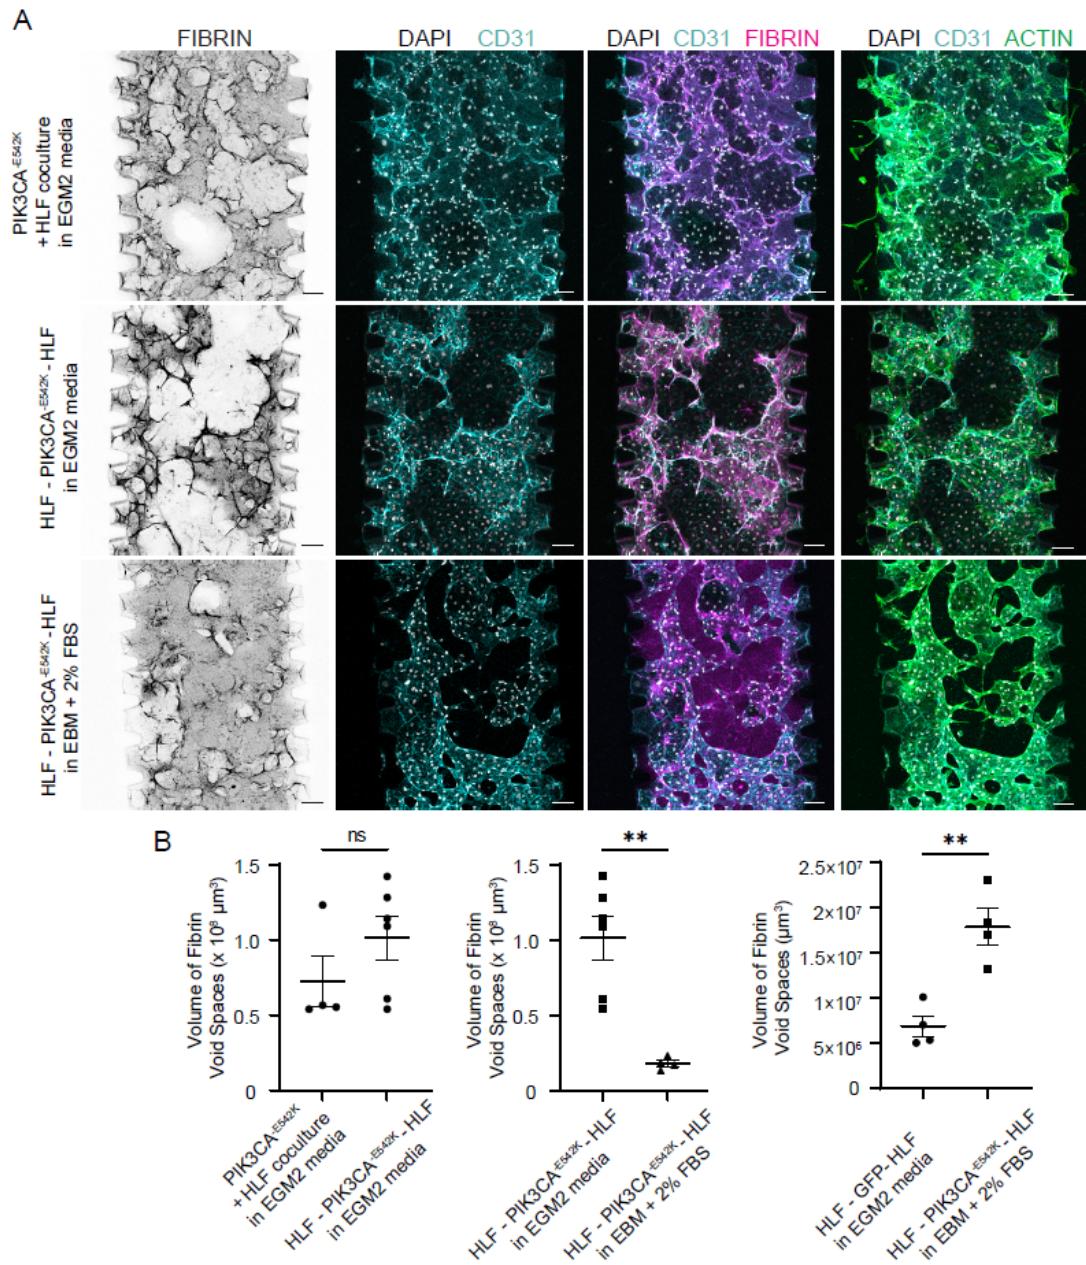

Fig. S6. Characterization of vascular malformation-like phenotype in PIK3CA E^{542K} vascular networks cultured under defined culture conditions.

(A) Representative confocal images (maximum intensity projection of the bottom half of vascular networks) of PIK3CA E^{542K} vascular networks labeled with Fibrin (magenta), DAPI (white), CD31 (cyan), and Actin (green). Vascular networks were generated by co-culturing endothelial cells and HLFs in the same compartment (PIK3CA E^{542K} + HLF) or in different spatial compartments (HLF-PIK3CA E^{542K} - HLF). Cells were cultured for 3 days in complete EGM2 media or in reduced growth factors media (EBM + 2% FBS). Scale bar = 100 μm . (B) Volumetric quantification of void spaces in fibrin hydrogel of vascular network formed in (A) ($n \geq 3$; mean \pm s.e.m; two-tailed unpaired Student t-test, ns = not significant; ** $p \leq 0.01$).

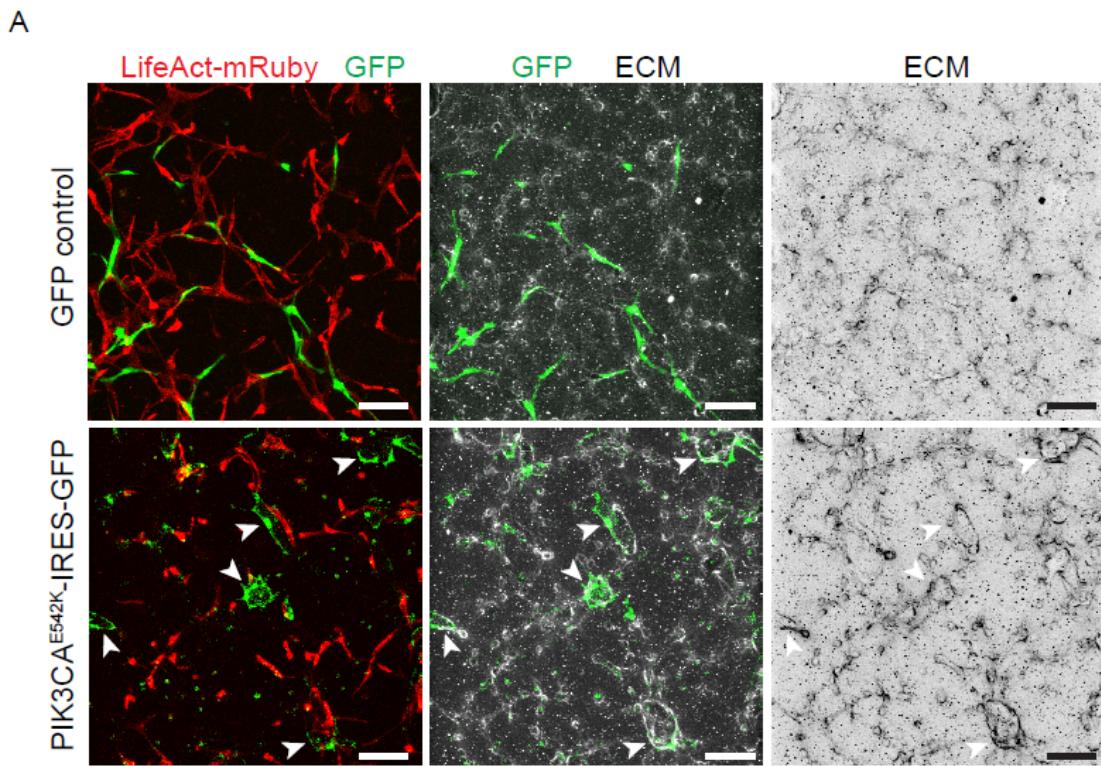

Fig. S7. Localized ECM remodeling and lesion formation by PIK3CA^{E542K} endothelial cells in mosaic vascular network.
