# Single-cell spatial landscapes of the lung tumour immune microenvironment

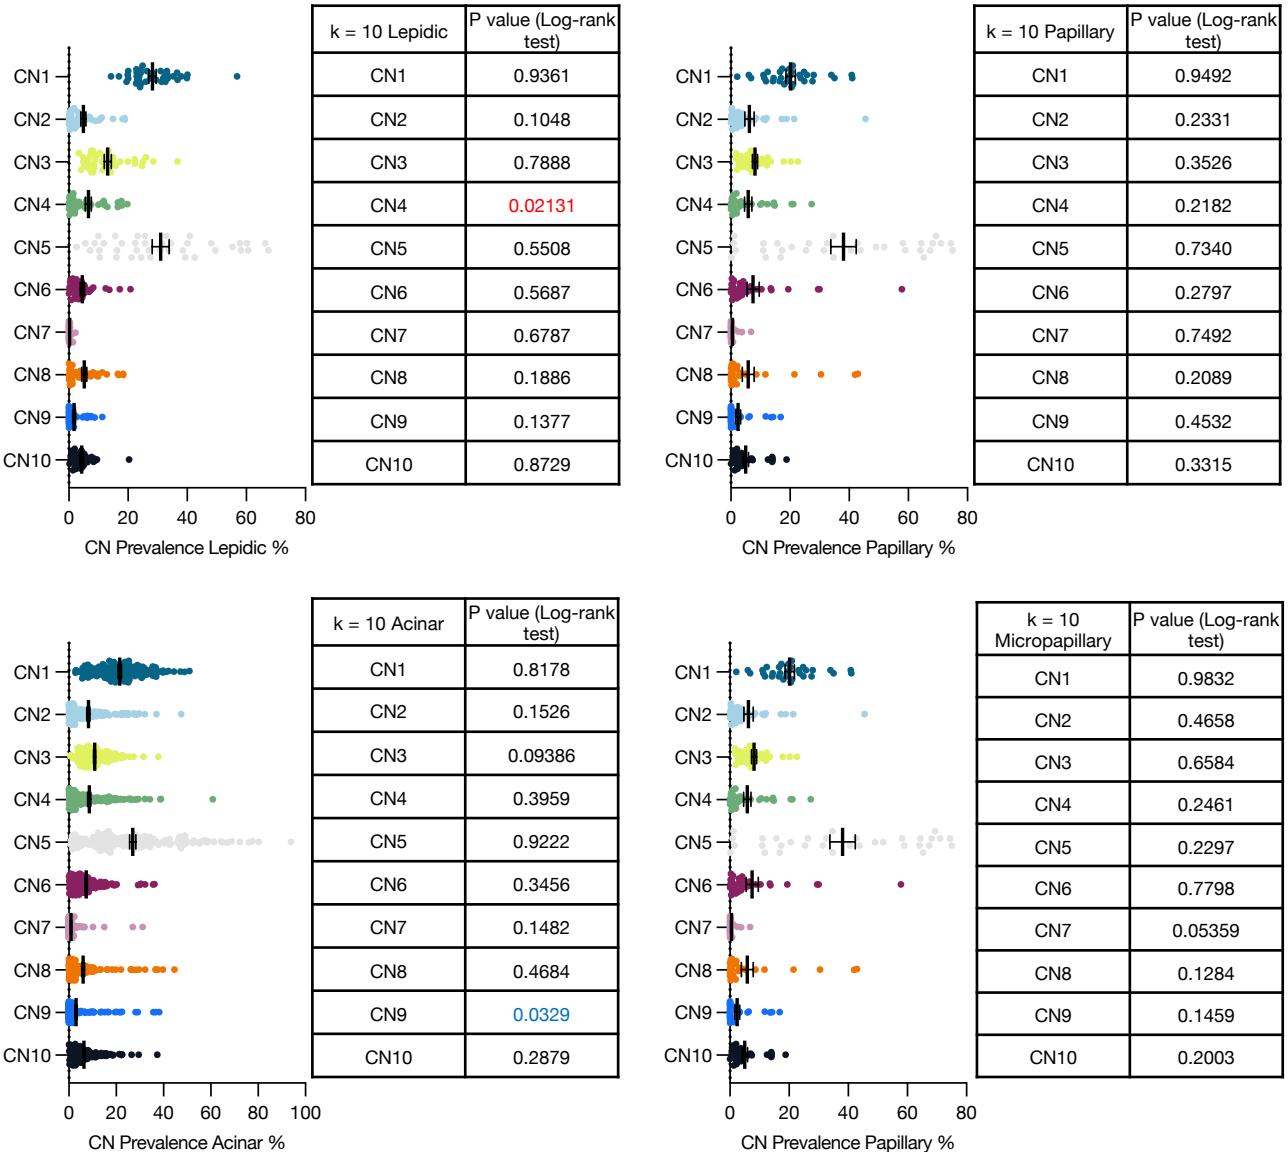

---

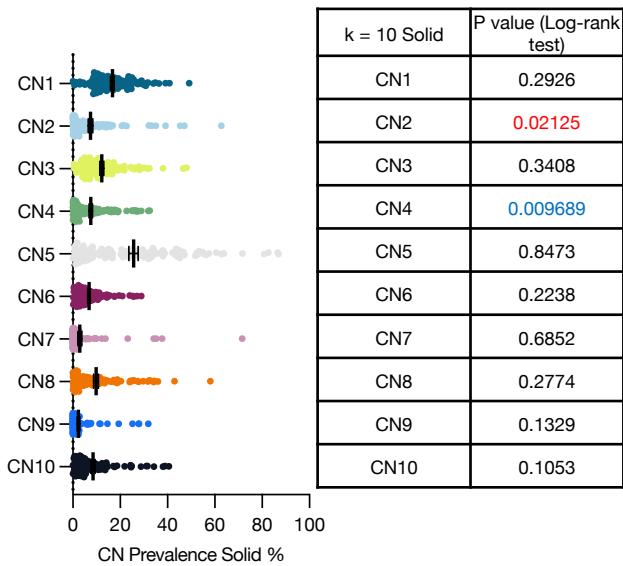

In the format provided by the  
authors and unedited

**Supplementary Fig. 1: Single cell prevalence across clinical variables.** Prevalence of cancer cells, neutrophils, B cells, NK cells, DC cells, endothelial cells, mast cells,  $T_H$ ,  $T_{reg}$ , T other, M1-like Mac, M2-like Mac, CI Mo, Int Mo, Non-CI Mo and undefined cells across sex (Female n = 233, Male n = 183), age (<75 yo n = 369, ≥75 yo n = 47), BMI (<30 n = 346, ≥30 n = 70), smoking status (Smoker n = 376, Non-smoker n = 38), pack-years (1-30 n = 89, ≥30 n = 256), stage (I-II n = 365, III-IV n = 50), progression status (Progression n = 64, No progression n = 340), and histological subgroup (Lepidic n = 40, Papillary n = 33, Acinar n = 190, Micropapillary n = 35, Solid n = 118). For exact P values, see Supplementary Table 4. Mean ± SEM.

**Supplementary Fig. 2: Cellular neighbourhood prevalence across 5 major histological patterns in 416 lung adenocarcinoma patients.** Prevalence of 10 cellular neighbourhoods across the five histological subtypes (Lepidic n = 40, Papillary n = 33, Acinar n = 190, Micropapillary n = 35, Solid n = 118). Tables depict result of log-rank test for the overall survival based on low (z score <0) and high (z score ≥0) prevalence of depicted neighbourhoods across histological subtypes. Black p values indicate no significant difference ( $p \geq 0.05$ ) in survival between the two groups. Blue p values indicate better survival ( $p < 0.05$ ) with high prevalence and red p values indicate better survival ( $p < 0.05$ ) with low prevalence of the depicted groups. Mean ± SEM. Statistical analysis (log-rank test).

**Supplementary Table 7: Comparison of 30 cellular neighbourhoods between various clinical parameters.**

Colour of the p values indicates higher prevalence or improved survival\* for the clinical group of the same colour. FDR-corrected two-tailed Student t-test for sex, age, BMI, smoking status, pack-years, stage, progression status; one-way ANOVA with Tukey multiple comparison test for histological group; log-rank test for survival
