eFigure 1. Proportion of Hospice Enrollees From the Community (With and Without Home Health) Over Time, Including Those in TM in ACOs (“ACO”) vs TM Not in ACOs (“TM”)

Legend: Data source: Medicare claims data from 2011, 2013, 2016 and 2018. MA= Medicare Advantage, TM= traditional Medicare. MA/TM status determined from insurance enrollment in the last month of life. Community is defined as site of care prior to hospice enrollment being a non-institutional setting with or without home health services, compared to a hospital or nursing facility.

eTable 2. Adjusted Increase in the Proportion of Community vs Hospital Enrollment, Results for All Sensitivity Analyses			
	TM- not ACO	MA	TM- ACO
Primary model	Reference	8.09% (7.96%-8.21%)	0.80% (0.60%-1.01%)
Cohort with cancer as hospice primary diagnosis	Reference	6.64% (6.41%-6.87%)	0.55% (0.17%-0.93%)
MA/ACO status determined 12 months prior to death	Reference	7.22% (7.10%-7.34%)	0.53% (0.33%-0.74%)
Non-duals	Reference	7.82% (7.68%-7.96%)	0.13% (-0.11%-0.36%)
Duals	Reference	8.52% (8.29%-8.75%)	3.58% (3.17%-4.00%)
TM= Traditional Medicare, ACO=Accountable Care Organization, MA= Medicare Advantage. For all models, covariates included decedent age at death, sex, race/ethnicity, year of death, dual status, end-stage renal disease status, and hospice primary diagnosis (categorized as cancer, chronic obstructive lung disease (COPD), congestive heart failure (CHF), dementia, cerebral vascular injury (CVA), and other).			

eFigure 2. Adjusted Difference in the Proportion of Community Hospice Enrollment in Each Subgroup vs Those Remaining in TM the Entire Last Year of Life (N = 2 194 624)

Legend: Data source: Medicare claims data from 2011, 2013, 2016 and 2018. Proportions of >0% indicate greater hospice enrollment in the indicated population vs. those remaining in TM the entire year. Proportions of <0% indicate lower hospice enrollment in the indicated population vs. those remaining in TM the entire year. Model adjusted for age at death, sex, race/ethnicity, year of death, Medicaid status, end-stage renal disease status, and hospice primary diagnosis (categorized as cancer, chronic obstructive lung disease, congestive heart failure, dementia, cerebral vascular injury, or other) and county-level fixed effects.

eTable 3. Adjusted Difference in the Proportion of Community Hospice Enrollment in MA vs TM Non-ACO vs. TM in ACOs, 2016 and 2018		
	OR (95% CI)	p-value
TM non-ACO	Reference	
MA	7.5% (7.3%-7.6%)	<0.001
TM in ACO	0.5% (0.3%-0.8%)	<0.001
TM= Traditional Medicare, MA=Medicare Advantage, ACO= Accountable Care Organization

Data source: Medicare claims data from 2011, 2013, 2016 and 2018. IQR=interquartile range, ESRD= end-stage renal disease, COPD= chronic obstructive pulmonary disease, CHF= congestive heart failure, CVA= cerebrovascular accident.

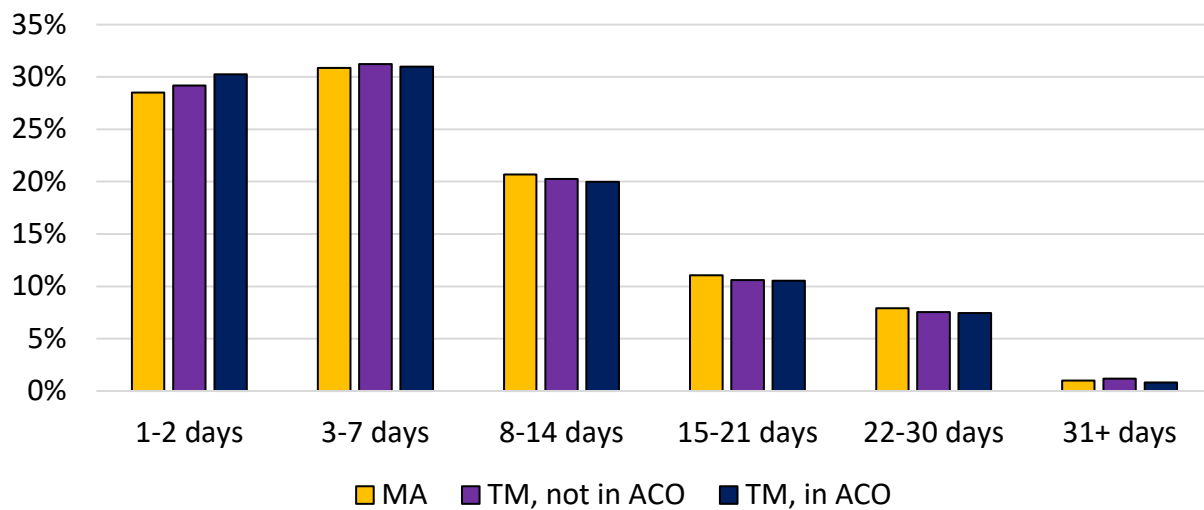

eTable 5. Adjusted Model Predicting Hospice LOS, Stratifying by Insurance Type

A. Among all insurance types		
Site of care prior to hospice:	Coefficient	95% Confidence Interval
Acute care hospital	(Reference)	(Reference)
Other hospital	0.81	0.70-0.91
Skilled nursing facility	2.31	2.26-2.36
Nursing home	2.85	2.82-2.89
Community with home health	3.79	3.75-3.83
Community without home health	4.42	4.40-4.45
B. Among those in MA		
Site of care prior to hospice:	Coefficient	95% Confidence Interval
Acute care hospital	(Reference)	(Reference)
Other hospital	0.45	0.16-0.75
Skilled nursing facility	3.28	2.87-3.68
Nursing home	2.59	2.53-2.64
Community with home health	3.17	3.09-3.26
Community without home health	3.93	3.89-3.97
A. Among those in TM		
Site of care prior to hospice:	Coefficient	95% Confidence Interval
Acute care hospital	(Reference)	(Reference)
Other hospital	0.88	0.76-1.00
Skilled nursing facility	2.40	2.34-2.45
