Supplementary Figure 1. Direct comparison of histone post-translational modifications in two FRDA and corresponding IOS CT fully differentiated neuronal cultures. Investigation of Histone H3 post-translational modifications of *FXN* 5'-end at exon 1 (Ex1), intronic region (intron 1) upstream (IntP1, IntP2) of GAA expansion as reported in Figure 1. This is an excerpt from Figure 1 in which for clarity results are only shown for ISO CT IcFA4 and IcFA5 (green diamonds) and corresponding FRDA lines FA 4 and FA5 (blue squares), labeled as 4 and 5.

Supplementary Figure 2. Western Blot analysis of frataxin expression. Frataxin expression was evaluated by Western Blot in differentiated fully mature neurons in two independent biological replicates per line ($n = 2$; A: representative blot). Protein expression was normalized to GAPDH. Mean values obtained for each group (CT, FRDA and ISO CT) were compared (Mean \pm SD). Histograms (B) represent mean values of biological replicates for each group, and error bars represent the standard deviation of mean (SD). Each dot represents the mean of two independent biological replicates per line. A significant decrease in Frataxin expression was observed in FRDA lines compared with CT, along with a recovery of frataxin expression in ISO CT neurons. No significant differences were observed between CT and IC lines (two-way ANOVA with Bonferroni's test for multiple comparisons; * $p < 0.05$; *** $p < 0.001$). CT: Control; FRDA: Friedreich Ataxia; ISO CT: Isogenic Control. Original uncropped gel images are in C (Frataxin), D (GAPDH), E (Frataxin+GAPDH two-color image). Uncropped gels contain one extra sample (third lane from the right) corresponding to an FRDA line that was not further utilized in the analyses because of aberrant growth and altered karyotype.

Supplementary Figure 3. Transcriptome profiling of differentiating ISO CT cultures. (A) Heatmaps representing Differentially Expressed Coding Genes between ISO CT and CT ($| \log_2(\text{Fold Change}) | > 1$; adjusted p -value < 0.1), for each stage of differentiation (yellow: iPSCs; green: developing neurons; violet: mature neurons). For each gene, the $\log_2(\text{Fold Change})$ between ISO CT and CT lines is shown on the right side of the corresponding heatmap. For each comparison, the transcriptional level of identified DEGs was represented also for the FRDA group. Colour scale represents $\log_2(\text{Normalized read counts})$ values. **(B)** Heatmaps representing differentially expressed

were analysed and represented as in (B). For each DEG, the \log_2 (Fold Change) between ISO CT and CT lines at each stage of differentiation is shown on the right side of the corresponding heatmap (iPSCs: left; developing neurons: middle; mature neurons: right). Non-coding DEGs common to all stages of differentiation are highlighted in bold. (n=2 for CT; n=5 for FRDA; n=3 for ISO CT).

Supplementary Figure 4. Analysis of sensory neuronal markers in differentiated cultures.
Heatmaps representing sensory neuron-specific transcripts detected in differentiated cultures. (A) Proprioceptive-specific genes were schematically separated in categories based on their function or cellular localization. (B) Nociceptive and mechanoreceptive-specific genes expressed in differentiated cultures. Genes common to mechanoreceptive and proprioceptive neurons are highlighted in bold. For each gene, the \log_2 (Fold Change) between FRDA and CT neurons (left) or ISO CT and CT neurons (right) is shown on the right side of the corresponding heatmap. Color scale represents \log_2 (normalized read counts) of transcripts.

Supplementary Figure 5. Transcriptome profile comparison of FA4 e FA5 with IcFA4 and IcFA5 for differentially expressed genes (DEGs). A direct comparison between FRDA and their sibling ISO CT lines was performed for all identified DEGs at the transcriptomic analysis. DEG expression was specifically investigated for upregulated (A) and downregulated (B) genes for lines FA4 and IcFA4 and FA5 and IcFA5, to evaluate the effects induced on gene expression by the removal of the GAA expansion mutation in genetically matched cell lines. For each gene, the ratio between FA4 and IcFA4 or FA5 and IcFA5 is represented on the right side of the corresponding heatmap, in \log_2 scale. Color scale represents \log_2 (normalized read counts) of transcripts. (n=1 for all lines).

Supplementary Figure 6. Transcriptome profile comparison of FRDA, CT and ISO CT lines for non-coding RNAs. Heatmaps representing differentially expressed non-coding genes or pseudogenes between FRDA and CT lines, at all stages of differentiation. For each DEG, the \log_2 (Fold Change) between FRDA and CT lines at each stage of differentiation is shown on the right side of the corresponding heatmap (iPSCs: left; developing neurons: middle; mature neurons:

Supplementary Figure 7. Volcano plots and Venn diagrams of DEPs in FRDA, CT and ISO CT neurons. **(A)** Volcano plots of significantly differentially expressed proteins in the comparison between FRDA and CT neurons (left), FRDA and ISO CT neurons (middle) and ISO CT and CT neurons (right). Red dots represent proteins exhibiting significant fold changes (p -value < 0.01). Of those, only proteins with absolute Log2(Fold Change) > 1 were selected for analysis (left and right sides of vertical broken lines). **(B)** Venn Diagrams of identified differentially expressed proteins in the comparison of FRDA and ISO CT neurons versus CT (left), FRDA and CT neurons versus ISO CT (middle) or CT and ISO CT neurons versus FRDA (right). Common identified proteins are indicated under the corresponding diagram.

Supplementary Figure 8. Proteome profile comparison of FA4 e FA5 with IcFA4 and IcFA5 for differentially expressed proteins (DEPs). A direct comparison between FRDA and their sibling ISO CT lines was performed for all identified DEPs at the proteomic analysis. DEP expression was specifically investigated for lines FA4 and IcFA4 (A) and FA5 and IcFA5 (B), to evaluate the effects induced on protein expression by the removal of the GAA expansion mutation in genetically matched cell lines. Color scale represents log2(Mean Peak Intensity) values of identified protein spectra. Exact values of Mean Peak Intensities for each protein are indicated in the heatmaps. ($n=1$ for all lines).

Supplementary Table 1. List of primers used for Chromatin Immunoprecipitation

| RT-qPCR Primers | Sequence (5' – 3') |
|-----------------|------------------------|
| Ex1 Forward | GGAGCAGCATGTGGACTCTC |
