Table E7. Classical HLA-DRB1 alleles ordered by associated risk of developing ADA. Corresponding amino acids at positions 9 and 71 are shown (discovery cohort: individuals sampled 6–36 months after treatment initiation, n=784). [†]denotes classical HLA-DRB1 alleles harbouring protective residues at either position 9 or position 71. W: tryptophan, E: glutamic acid, K: lysine, R: arginine.
