

Vaccine Confidence Index results

Jamie Griffith

03 February 2023

Notes on the code, analyses and results

If you, the reader, find any issues, mistakes, or otherwise have reason to comment, please contact Jamie Griffith at j-griffith@northwestern.edu. This research is funded by the National Institutes of Health (R01MD010440). Our clinicaltrials.gov number is NCT03584490.

Getting started

To begin the analyses, we first load the necessary packages to read in and analyse the data. Note that the whatsthedif package was developed by us in order to analyses data from this project. It contains scoring algorithms as well as some helpful functions. You can install and look at the package using the code below.

```
# Note to use: You may wish to ensure your packages are installed and up-to-date
# before running this code

if (!require("pacman")) install.packages("pacman")

library(pacman)

p_load(devtools,
       ggplot2,
       lavaan,
       magrittr,
       parallel,
       tableone,
       lubridate,
       xlsx,
       psych,
       update = TRUE)

if (!require("whatsthedif")) install_github("jameswgriffith/whatsthedif",
                                             auth_token = "56a3f57ab6935c2610336a67db61357108aa2e15")

library(whatsthedif)

# Detach/unload devtools because it is no longer needed
detach("package:devtools", unload = TRUE)
```

Reading in the data

The database for the project was maintained in REDCap. A .csv file was exported therefrom, read into R, and then reduced for the purposes of this paper. All data manipulation was done in R. The file below is the baseline assessment from the phone-based protocol (N = 304) merged with demographics and health literacy data from the parent study: phone_t1_screening_hl.rdata

There were 304 who completed a baseline assessment for the phone-based protocol.

VCI Completion

The rate of VCI completion was high, but only participants who completed 7 or more of the 8 items were retained in the analyses (i.e., 80% or more).

```
# How many valid VCI items?  
# On average  
mean(phone_t1_screening_hl$vci_valid)  
  
## [1] 7.6  
  
# Range  
range(phone_t1_screening_hl$vci_valid)  
  
## [1] 3 8
```

Parallel analysis to check number of components

The result was one component.

```
vci_recoded <- paste0("vci", 1:8, "_rec")  
  
# Examine a parallel analysis using the method of Lubbe  
set.seed(010440)  
polyPA(vc_dat[, vci_recoded],  
       replications = 1000,  
       prc = .99)  
  
## $sample_ev  
## [1] 3.62 1.47 0.83 0.65 0.50 0.37 0.32 0.24  
##  
## $reference_ev  
## [1] 2.18 1.48 1.29 1.15 1.03 0.94 0.83 0.68
```

Alpha overall, for English, and for Spanish

```

Dates of phone-baseline completion and screening dates

For the sample of 273, the dates of completion for the baseline for the phone protocol are as follows:

```
## [1] "2020-11-06" "2021-03-11"
```

The range of dates for screening were as follows:

```
## [1] "2018-09-18" "2020-02-26"
```
