

Supplementary Online Content

Supplementary Figure 1. Flowchart for the selection of the analyzed study sample from the UK Biobank Study

Supplementary Figure 2. Acceleration level during seven-day monitoring with fitted curve for the circadian rest-activity characteristics among participants without and with incident atrial fibrillation

Supplementary Figure 3. Standardized risk of incident atrial fibrillation according to genetic risk and amplitude

Supplementary Figure 4. Standardized risk of incident atrial fibrillation according to genetic risk and acrophase

Supplementary Figure 5. Standardized risk of incident atrial fibrillation according to genetic risk and pseudo-F

Supplementary Figure 6. Standardized risk of incident atrial fibrillation according to genetic risk and mesor

Supplementary Figure 7. Timeline of covariates collection

Supplementary Figure 8. Associations between circadian rest-activity characteristics and incident atrial fibrillation

Supplementary Table 1. Risk of Incident atrial fibrillation according to circadian rest-activity characteristics

Supplementary Table 2. Risk of Incident atrial fibrillation according to circadian rest-activity characteristics stratified by age categories

Supplementary Table 3. Risk of Incident atrial fibrillation according to circadian rest-activity characteristics stratified by sex categories

Supplementary Table 4. Risk of Incident atrial fibrillation according to genetic and circadian rest-activity characteristics

Supplementary Table 5. Sensitivity analysis on the association of circadian rest-activity characteristics and genetic risk with Incident atrial fibrillation by using competing risk regression (Fine and Gray)

Supplementary Table 6. Sensitivity analysis on the associations of circadian rest-activity characteristics and genetic risk with incident atrial fibrillation among participants without any missing covariate data

Supplementary Table 7. Sensitivity analysis on the associations of circadian rest-activity characteristics and genetic risk with incident atrial fibrillation by excluding events that occurred within the first year of follow-up

Supplementary Table 8. Sensitivity analysis on the associations of circadian rest-activity characteristics and genetic risk with atrial fibrillation by censoring up to Dec 31, 2019

Supplementary Table 9. Sensitivity analysis on the associations of circadian rest-activity characteristics and genetic risk with atrial fibrillation by excluding those reporting a history of shift work

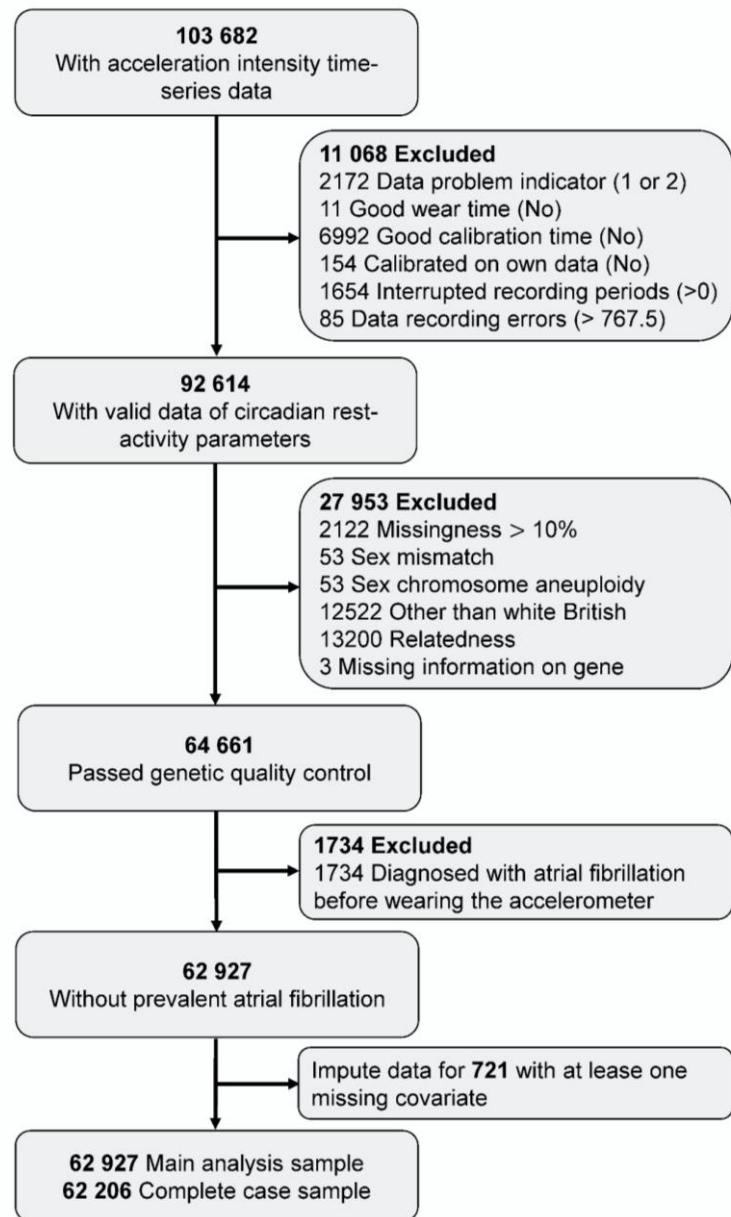

Supplementary Table 10. Risk of incident atrial fibrillation according to circadian rest-activity characteristics within each genetic risk category

Supplementary Table 11. Single-nucleotide polymorphisms used to build the genetic risk score for atrial fibrillation

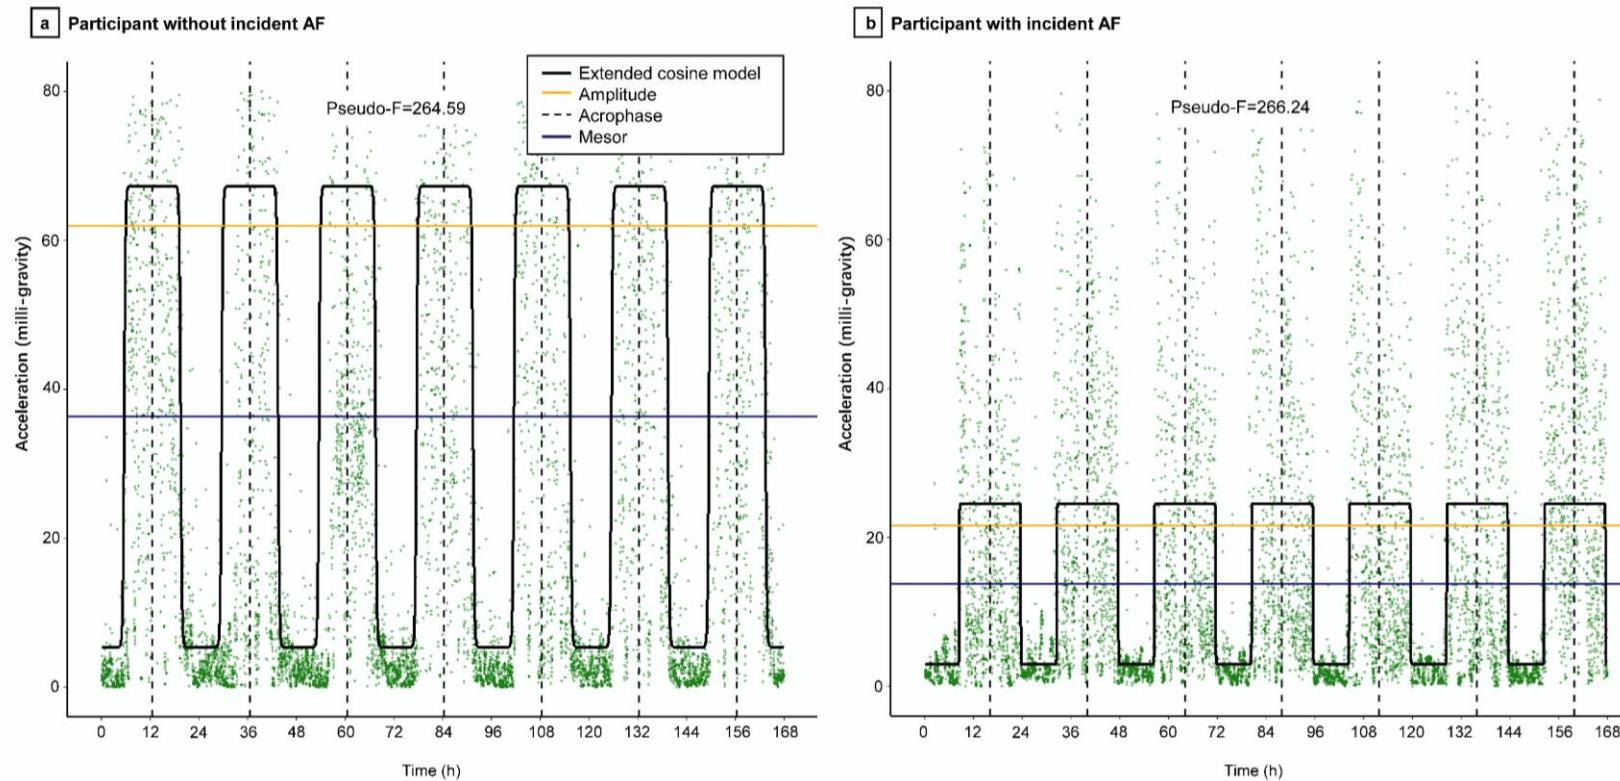

Supplementary Table 12. Codes used in the UK Biobank study to identify atrial fibrillation cases

Supplementary Table 13. The numbers (percentages) of participants with missing covariates

Supplementary Figure 1. Flowchart for the selection of the analyzed study sample from the UK Biobank Study

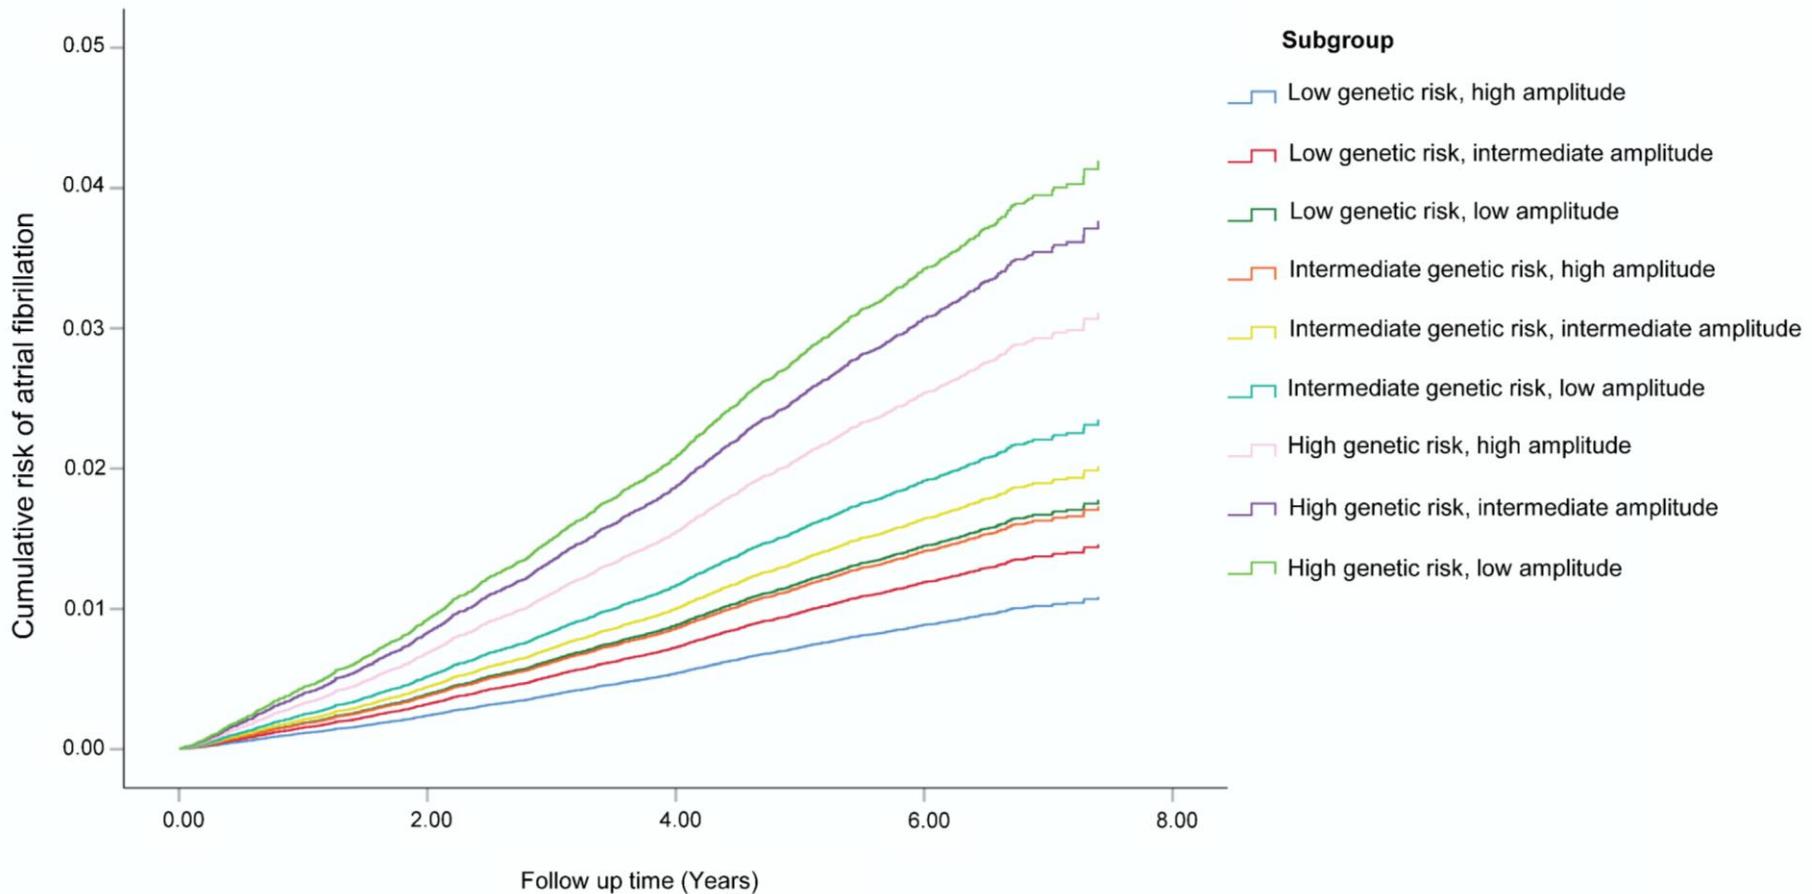

Supplementary Figure 2. Acceleration level during seven-day monitoring with fitted curve for the circadian rest-activity characteristics among participants without and with incident atrial fibrillation

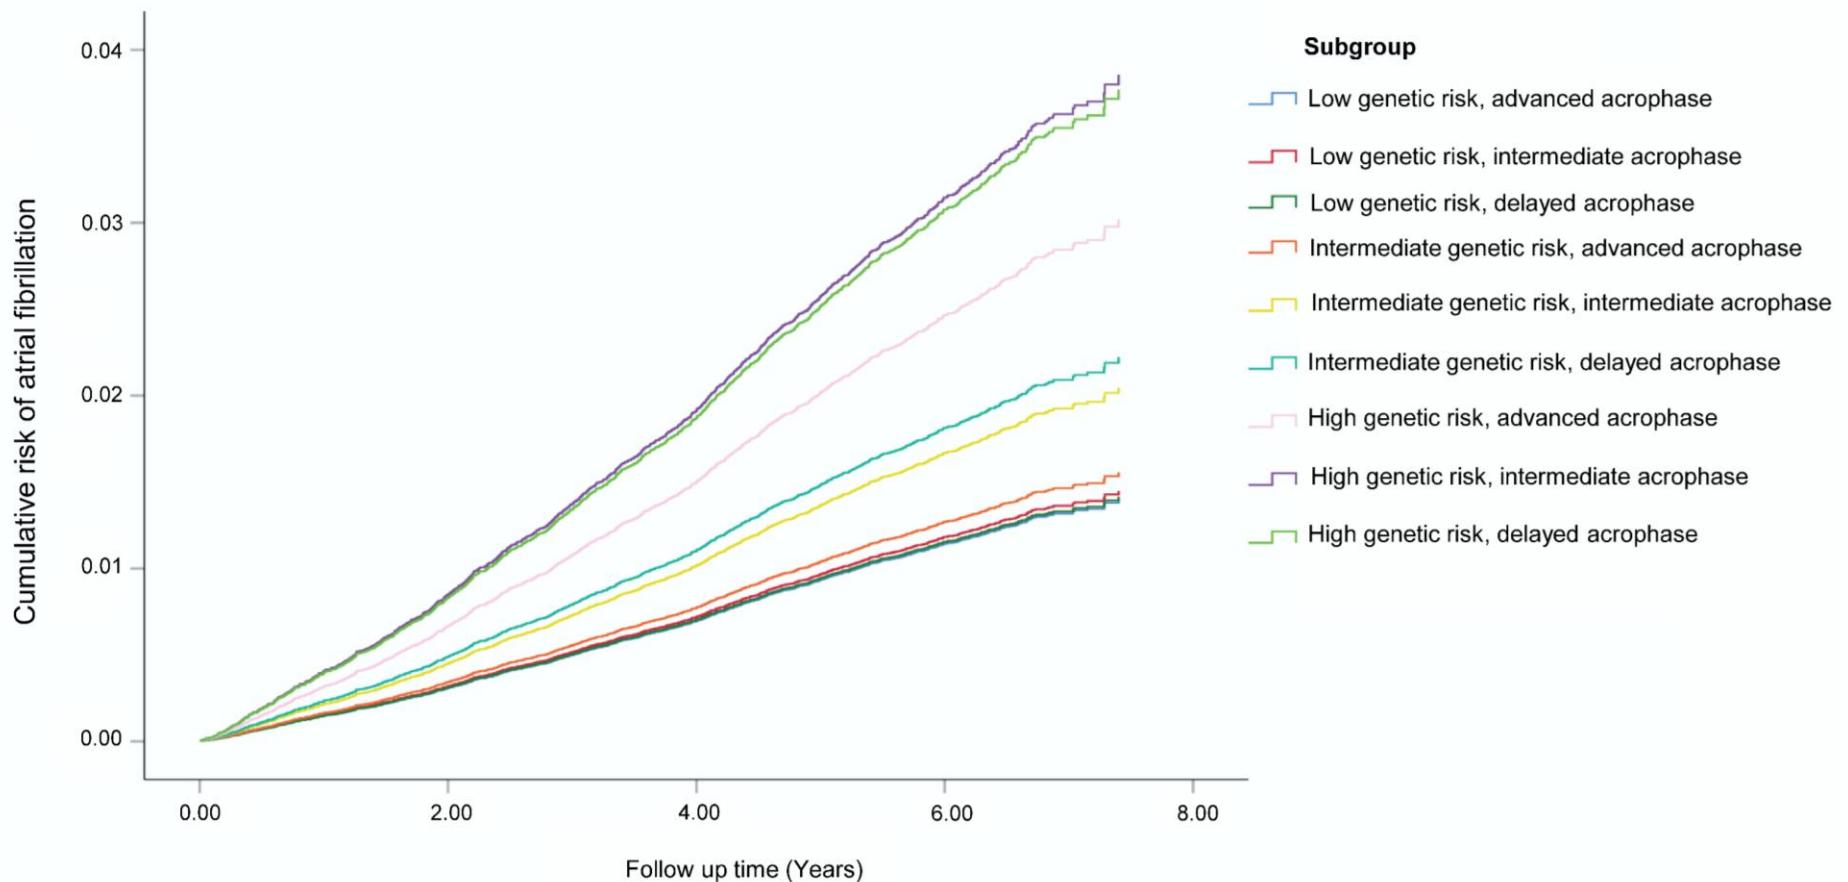

Abbreviation: AF, atrial fibrillation; Two participants, one without incident atrial fibrillation and the other one with incident atrial fibrillation, were selected from the study sample. a. The participant without incident atrial fibrillation had high amplitude and mesor as shown by the high overall level of activity and the high height of the fitted curve as well as advanced acrophase as shown by early peak activity of the fitted curve. b. The participant with incident atrial fibrillation had low amplitude and mesor as shown by the low overall level of activity and the damped fitted curve as well as delayed acrophase as shown by late peak activity of the fitted curve.

Supplementary Figure 3. Standardized risk of incident atrial fibrillation according to genetic risk and amplitude

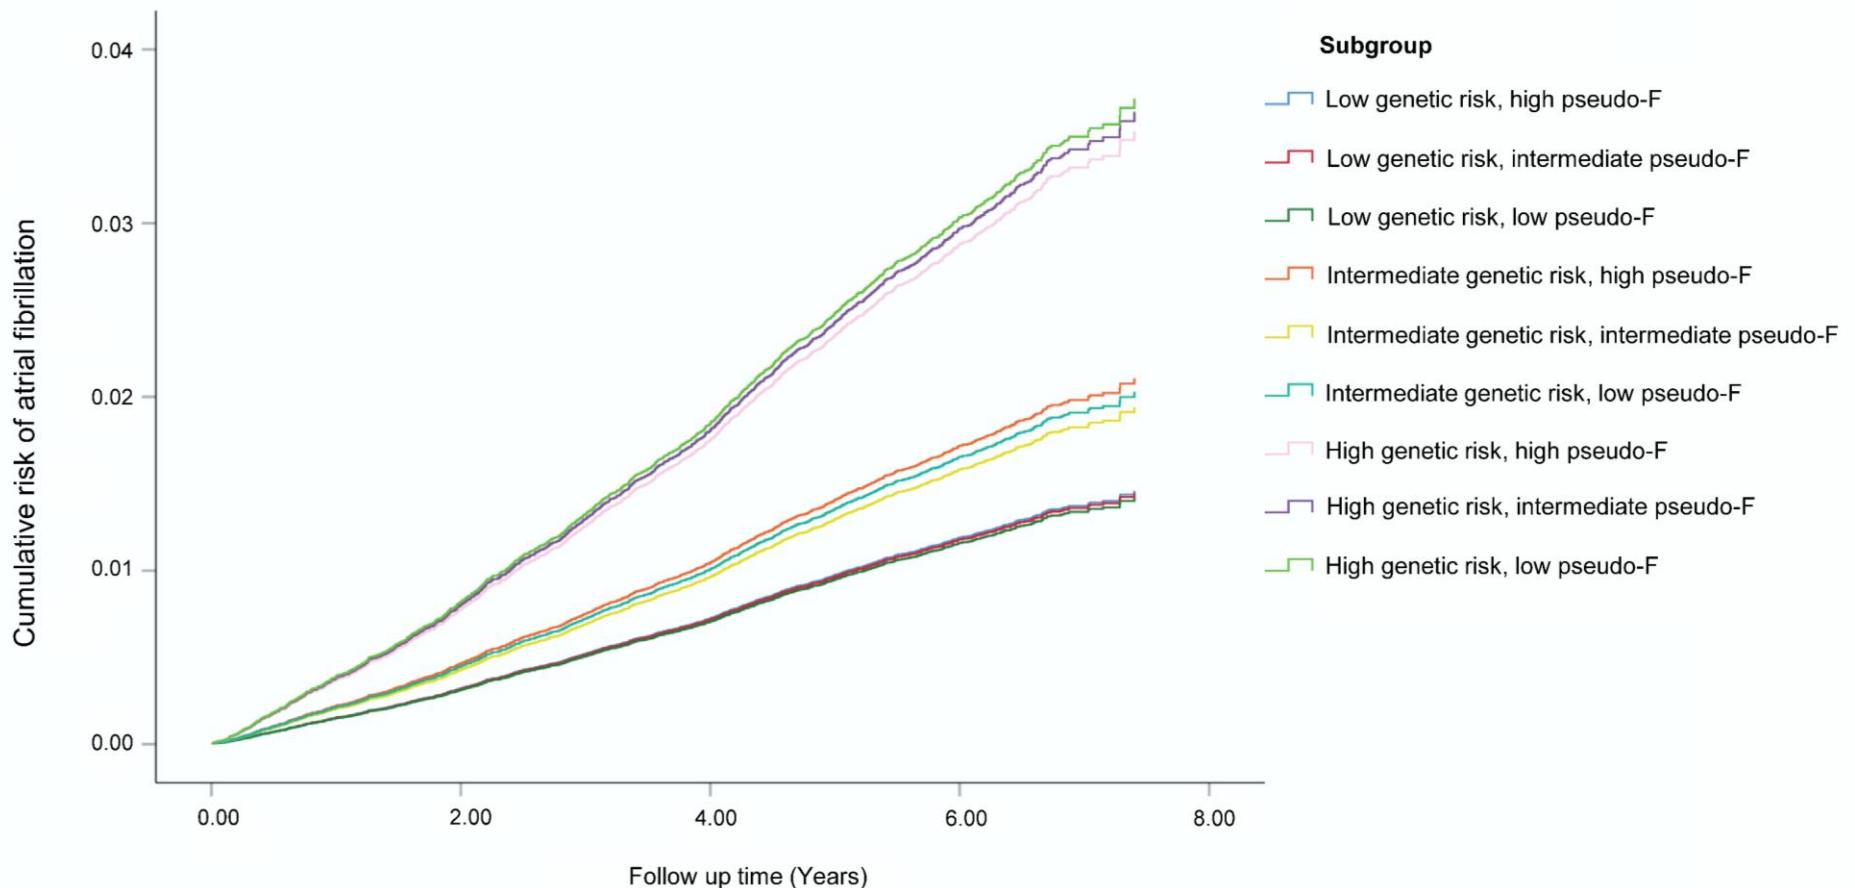

Abbreviation: AF, atrial fibrillation; BMI, body mass index. Cox proportional hazard models were adjusted for age, sex, Townsend deprivation index, recruitment centre, education level, season of accelerometer wear, BMI categories, healthy diet score, smoking status, alcohol intake, coffee consumption, tea consumption, hypertension, diabetes, dyslipidemia, sleep efficiency, sleep duration, genetic risk, and first 10 principal components of ancestry. Participants with prevalent AF were excluded.

Supplementary Figure 4. Standardized risk of incident atrial fibrillation according to genetic risk and acrophase

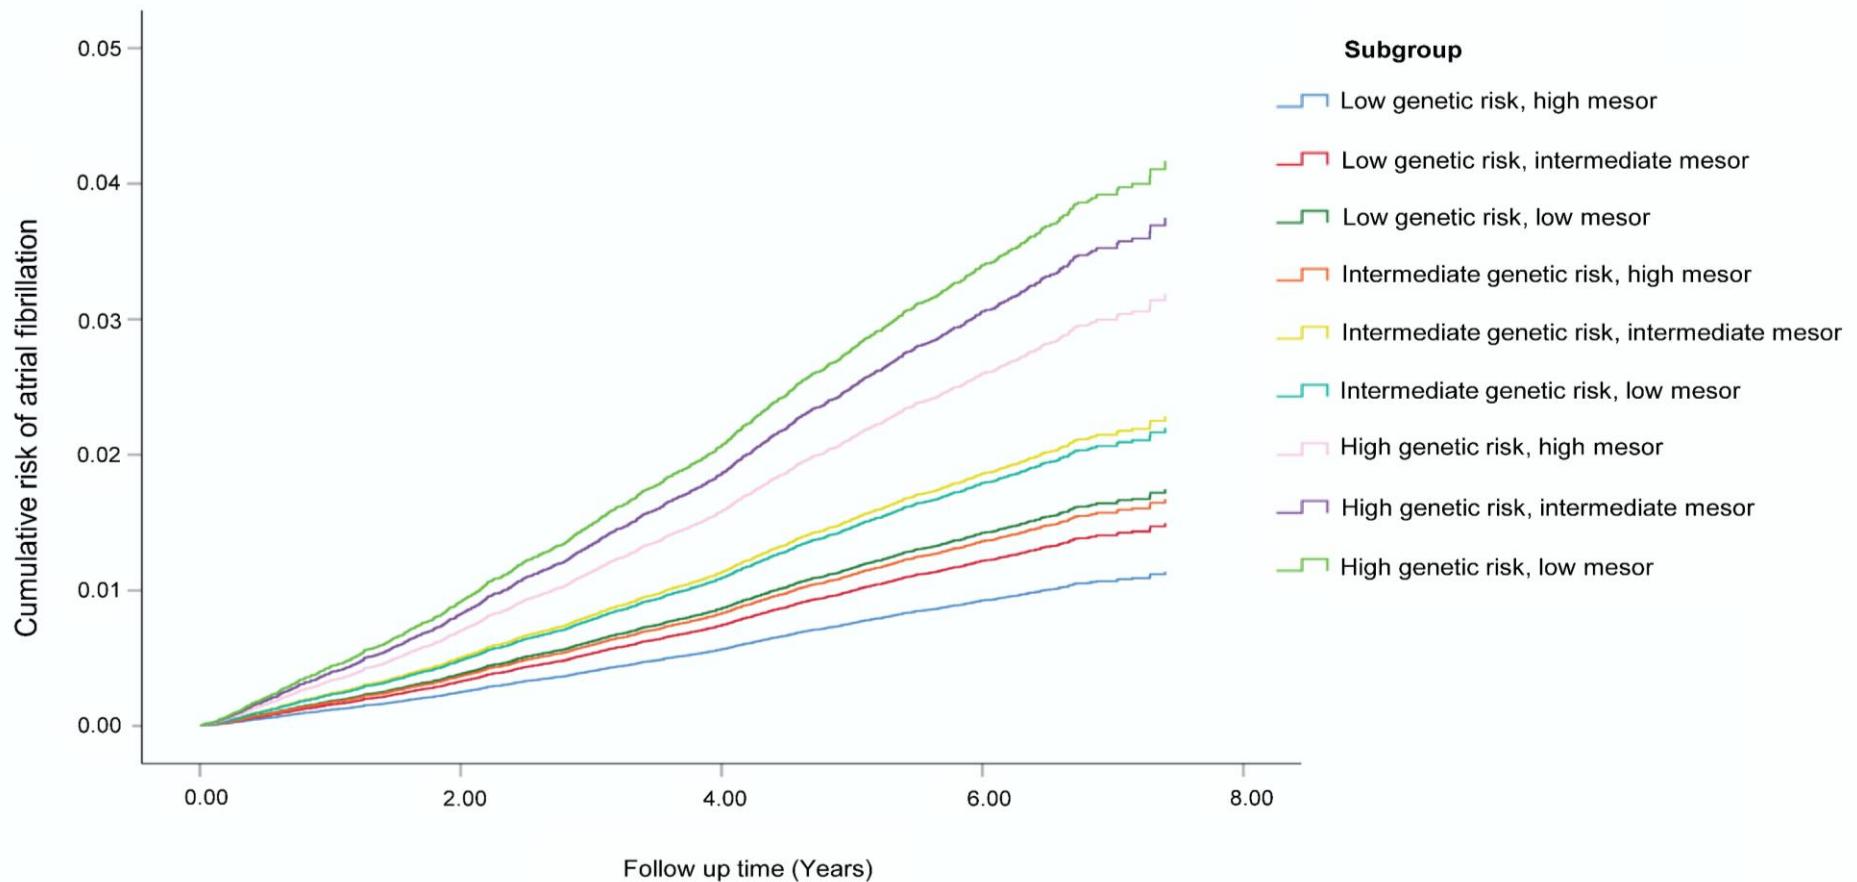

Abbreviation: AF, atrial fibrillation; BMI, body mass index. Cox proportional hazard models were adjusted for age, sex, Townsend deprivation index, recruitment centre, education level, season of accelerometer wear, BMI categories, healthy diet score, smoking status, alcohol intake, coffee consumption, tea consumption, hypertension, diabetes, dyslipidemia, sleep efficiency, sleep duration, genetic risk, and first 10 principal components of ancestry. Participants with prevalent AF were excluded.

Supplementary Figure 5. Standardized risk of incident atrial fibrillation according to genetic risk and pseudo-F

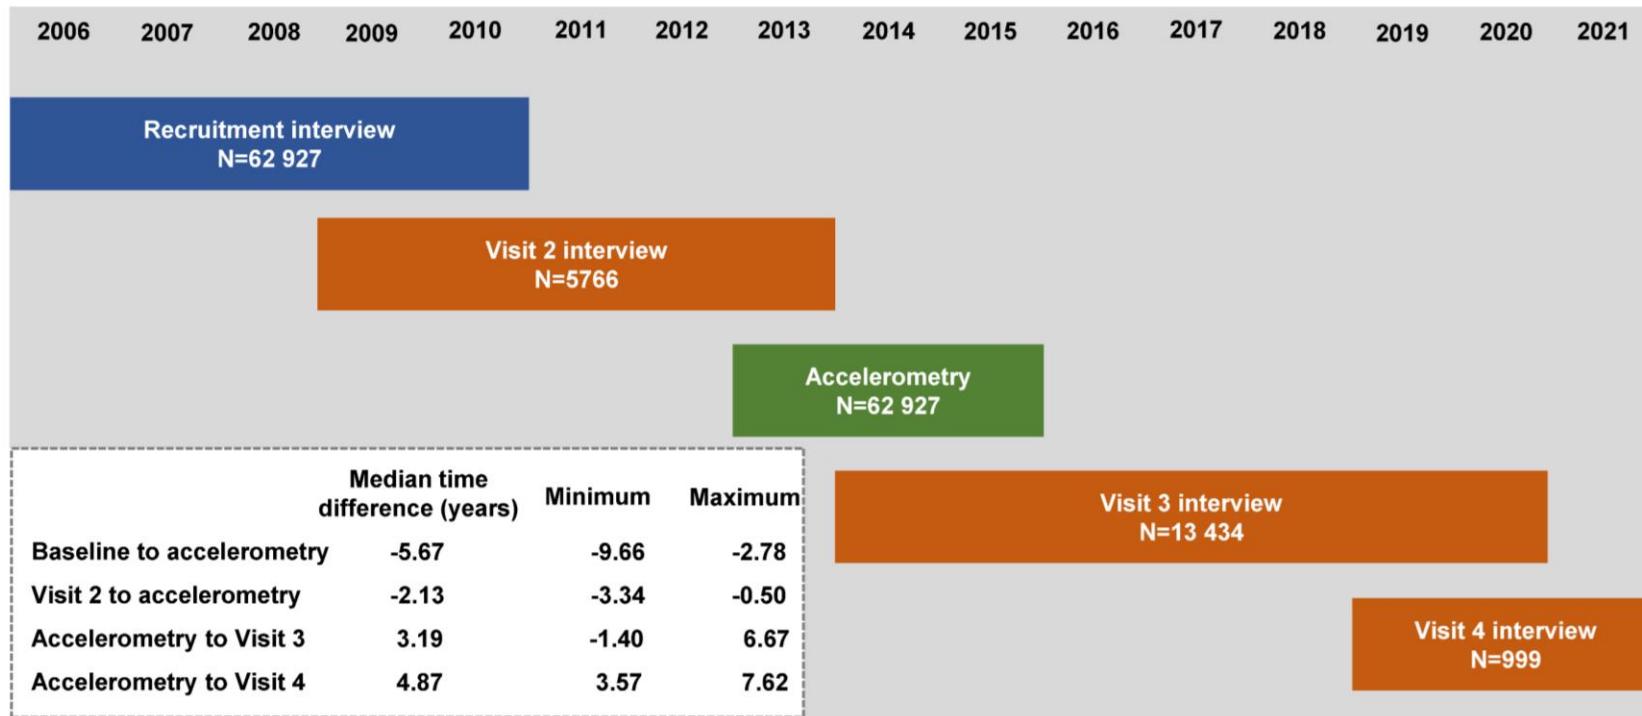

Abbreviation: AF, atrial fibrillation; BMI, body mass index. Cox proportional hazard models were adjusted for age, sex, Townsend deprivation index, recruitment centre, education level, season of accelerometer wear, BMI categories, healthy diet score, smoking status, alcohol intake, coffee consumption, tea consumption, hypertension, diabetes, dyslipidemia, sleep efficiency, sleep duration, genetic risk, and first 10 principal components of ancestry. Participants with prevalent AF were excluded.

Supplementary Figure 6. Standardized risk of incident atrial fibrillation according to genetic risk and mesor

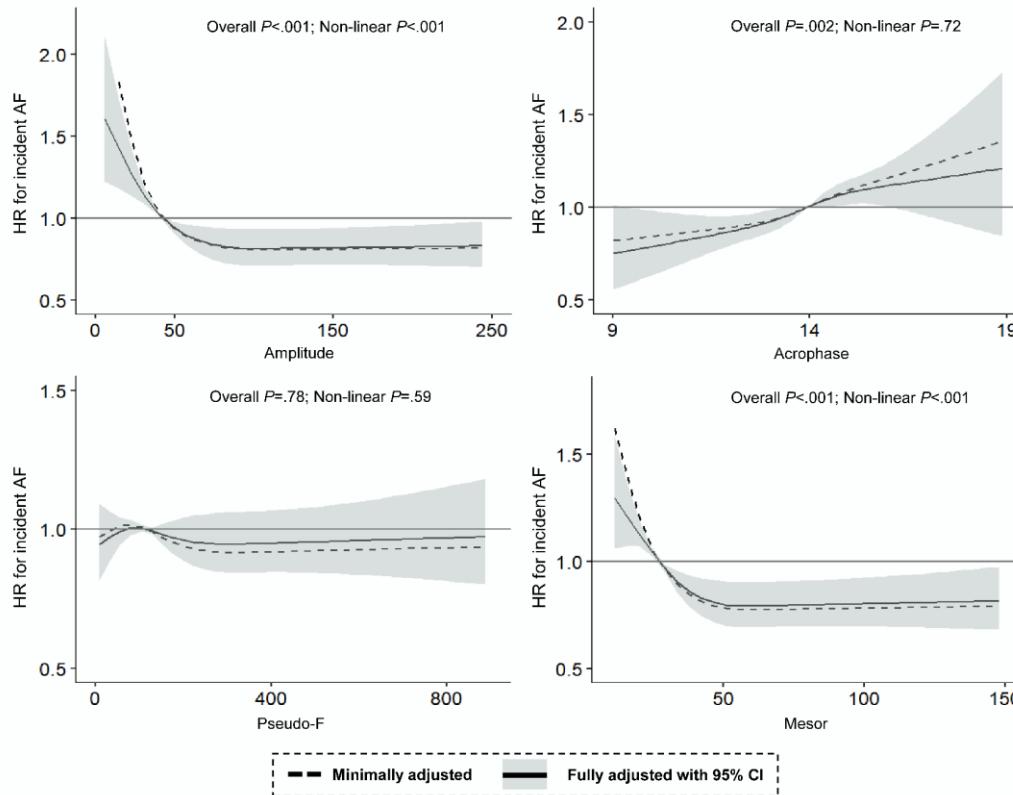

Abbreviation: AF, atrial fibrillation; BMI, body mass index. Cox proportional hazard models were adjusted for age, sex, Townsend deprivation index, recruitment centre, education level, season of accelerometer wear, BMI categories, healthy diet score, smoking status, alcohol intake, coffee consumption, tea consumption, hypertension, diabetes, dyslipidemia, sleep efficiency, sleep duration, genetic risk, and first 10 principal components of ancestry. Participants with prevalent AF were excluded.

Supplementary Figure 7. Timeline of covariates collection

Supplementary Figure 8. Associations between circadian rest-activity characteristics and incident atrial fibrillation

Abbreviation: AF, atrial fibrillation; BMI, body mass index; CI, confidence interval; HR, hazard ratio. In minimally adjusted models (Model 1, dash line), overall and non-linear testing analyses were adjusted for age and sex. In fully adjusted model (Model 4, solid line), overall and non-linear testing analyses were adjusted for age, sex, Townsend deprivation index, recruitment center, education level, season of accelerometer wear, BMI categories, healthy diet score, smoking status, alcohol intake, coffee consumption, tea consumption, hypertension, diabetes, dyslipidemia, sleep efficiency, and sleep duration, genetic risk, and first 10 principal components of ancestry. Shaded areas represent 95% confidence intervals (CIs). Participants with prevalent AF were excluded.

Abbreviation: AF, atrial fibrillation; BMI, body mass index; CI, confidence interval; FDR, false-discovery rate; HR, hazard ratio.

Analyses were conducted using Cox proportional hazard models. **Model 1** was adjusted for age, sex, and first 10 principal components of ancestry. **Model 2** was adjusted as in model 1 and for Townsend deprivation index, recruitment centre, education level, and season of accelerometer wear. **Model 3** was adjusted as in model 2 and for BMI categories, healthy diet score, smoking status, alcohol intake, coffee consumption, tea consumption, hypertension, diabetes, and dyslipidemia. **Model 4** was adjusted as in model 3 and for sleep efficiency and sleep duration. Participants with prevalent AF were excluded. ^aP values remained significant after multiple testing with FDR method.

Abbreviation: AF, atrial fibrillation; BMI, body mass index; CI, confidence interval; FDR, false-discovery rate; HR, hazard ratio.

Analyses were conducted using Cox proportional hazard models. **Model 1** was adjusted for age, sex, and first 10 principal components of ancestry. **Model 2** was adjusted as in model 1 and for Townsend deprivation index, recruitment centre, education level, and season of accelerometer wear. **Model 3** was adjusted as in model 2 and for BMI categories, healthy diet score, smoking status, alcohol intake, coffee consumption, tea consumption, hypertension, diabetes, and dyslipidemia. **Model 4** was adjusted as in model 3 and for sleep efficiency and sleep duration. Participants with prevalent AF were excluded. ^aP values remained significant after multiple testing with FDR method.

Supplementary Table 7. Sensitivity analysis on the associations of circadian rest-activity characteristics and genetic risk with incident atrial fibrillation by excluding events that occurred within the first year of follow-up

Abbreviation: AF, atrial fibrillation; BMI, body mass index; CI, confidence interval; FDR, false-discovery rate; HR, hazard ratio.

Analyses were conducted using Cox proportional hazard models. **Model 1** was adjusted for age, sex, and first 10 principal components of ancestry. **Model 2** was adjusted as in model 1 and for Townsend deprivation index, recruitment centre, education level, and season of accelerometer wear. **Model 3** was adjusted as in model 2 and for BMI categories, healthy diet score, smoking status, alcohol intake, coffee consumption, tea consumption, hypertension, diabetes, and dyslipidemia. **Model 4** was adjusted as in model 3 and for sleep efficiency and sleep duration. Participants with prevalent AF were excluded. ^aP values remained significant after multiple testing with FDR method.

Supplementary Table 10. Risk of Incident atrial fibrillation according to circadian rest-activity characteristics within each genetic risk category

Taken from: Nielsen JB, et al. Biobank-driven genomic discovery yields new insight into atrial fibrillation biology. Nat Genet. 2018;50(9):1234-1239.

Supplementary Table 12. Codes used in the UK Biobank study to identify atrial fibrillation cases

Data fields	Field names	Data codes	Data code definitions
20002	Non-cancer illness code, self-report	1471, 1483	Atrial fibrillation, Atrial flutter
41271	Diagnoses - ICD9	4273	Atrial fibrillation and flutter
41270,	Diagnoses - ICD10	I48, I48.0,	Atrial fibrillation and flutter,
40001,	Primary cause of death: ICD10,	I48.1, I48.2,	Paroxysmal atrial fibrillation,
40002	Secondary cause of death: ICD10	I48.3, I48.4, I48.9	Persistent atrial fibrillation, Chronic atrial fibrillation, Typical atrial flutter, Atypical atrial flutter, Atrial fibrillation and atrial flutter, unspecified
41272	Operative procedures	K62.1, K62.2, K62.3, K62.4	Percutaneous transluminal ablation of pulmonary vein to left atrium conducting system, Percutaneous transluminal ablation of atrial wall for atrial flutter, Percutaneous transluminal ablation of conducting system of heart for atrial flutter NEC, Percutaneous transluminal internal cardioversion NEC

Supplementary Table 13. The numbers (percentages) of participants with missing covariates

Covariates	N	%
Any missing covariate	721	1.15
Age at accelerometry (years)	0	0.00
Female	0	0.00
Townsend deprivation index	73	0.12
Recruitment regions	0	0.00
Education level	178	0.28
Season of accelerometer wear	0	0.00
Body mass index categories	89	0.14
Healthy diet score	1	0.002
Smoking status	108	0.17
Alcohol consumption	14	0.02
Coffee consumption	0	0.00
Tea consumption	37	0.06
Hypertension history	39	0.06
Diabetes history	51	0.08
Dyslipidemia history	0	0.00
Sleep efficiency (%)	150	0.24
Sleep duration	150	0.24
