10 **Supplementary Text**
11

12 ***99% closed-reference OTU analysis***

13 A 99% similarity closed-reference OTU-picking strategy to further minimize potential contamination
14 showed a ~10-fold decrease in the number of OTUs and read numbers (1,065 OTUs and 70,527 reads
15 were left). Further, this reduced the number of retrieved samples to 93.

16 Following the previously described filtering steps (hold only OTUs represented by more than 500
17 sequences and present in at least 10 samples), 335 OTUs (67,151 reads) associated to 14 samples
18 were left. For this reduced dataset, 2 OTUs associated to Chloroplast were found, represented by 115
19 sequences in total. The very reduced number of samples, OTUs and total reads left in the dataset
20 caused the 99% OTU approach to be discontinued.

21

22 **Supplementary Methodology**

23

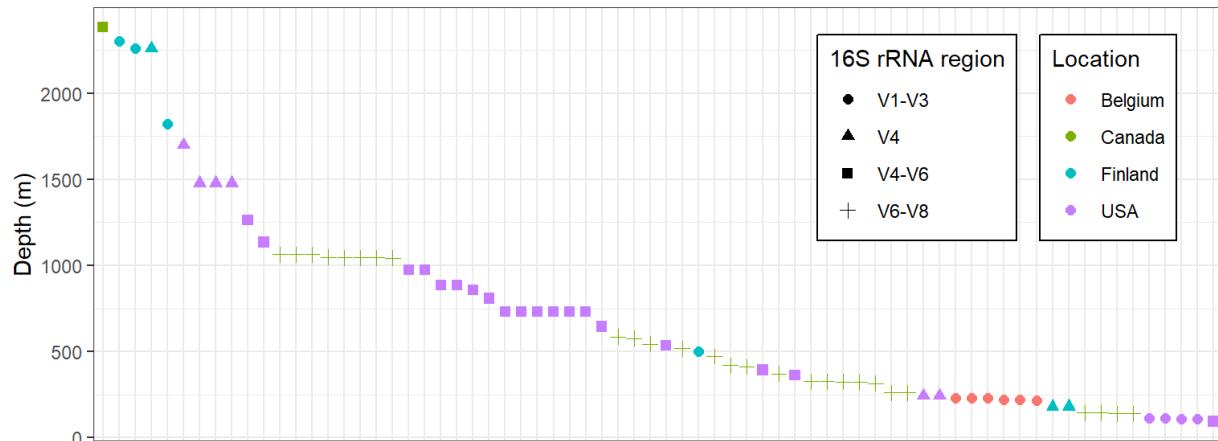

24 ***Phylogeny of Pseudomonas representative sequences***

25 Representative 16S rRNA gene sequences for *Pseudomonas* OTUs in the dataset were isolated by
26 retrieving OTU IDs affiliated to this genus in the final dataset using the *subset_taxa* function within
27 *phyloseq*[1]. The SILVA 123 database was then queried against the list of OTU IDs and the results
28 deposited in a FASTA file. Outgroup sequences of genus *Sphingomonas* (Proteobacteria,
29 Alphaproteobacteria, Sphingomonadales, Sphingomonadaceae) were obtained directly from the
30 SILVA database (<https://www.arb-silva.de/>) and added along with the retrieved *Pseudomonas* 16S
31 rRNA gene sequences to a final FASTA file.

32 Using MEGA7[2], an alignment was performed using the MUSCLE[3] algorithm and 8 iterations of
33 the UPGMB (combines Neighbour-Joining[4] and UPGMA - Unweighted Pair Group Method with
34 Arithmetic mean) clustering method. An optimal Neighbour-Joining[4] tree (*cf. Supplementary*
35 **Figure 4**) was then created using 500 bootstrapped replicates and the Maximum Composite
36 Likelihood (MCL)[5] method to calculate evolutionary distances.

37 **Supplementary Figures**

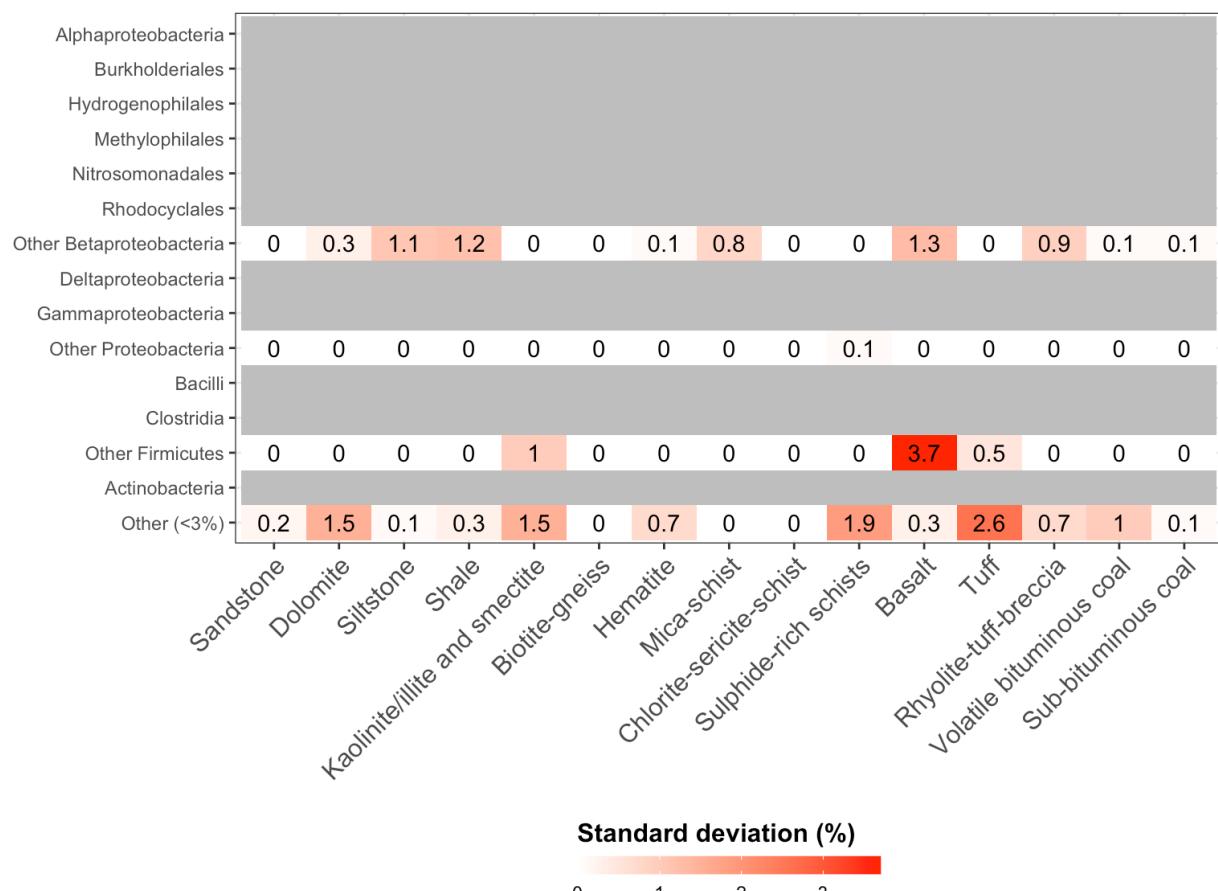

38

39

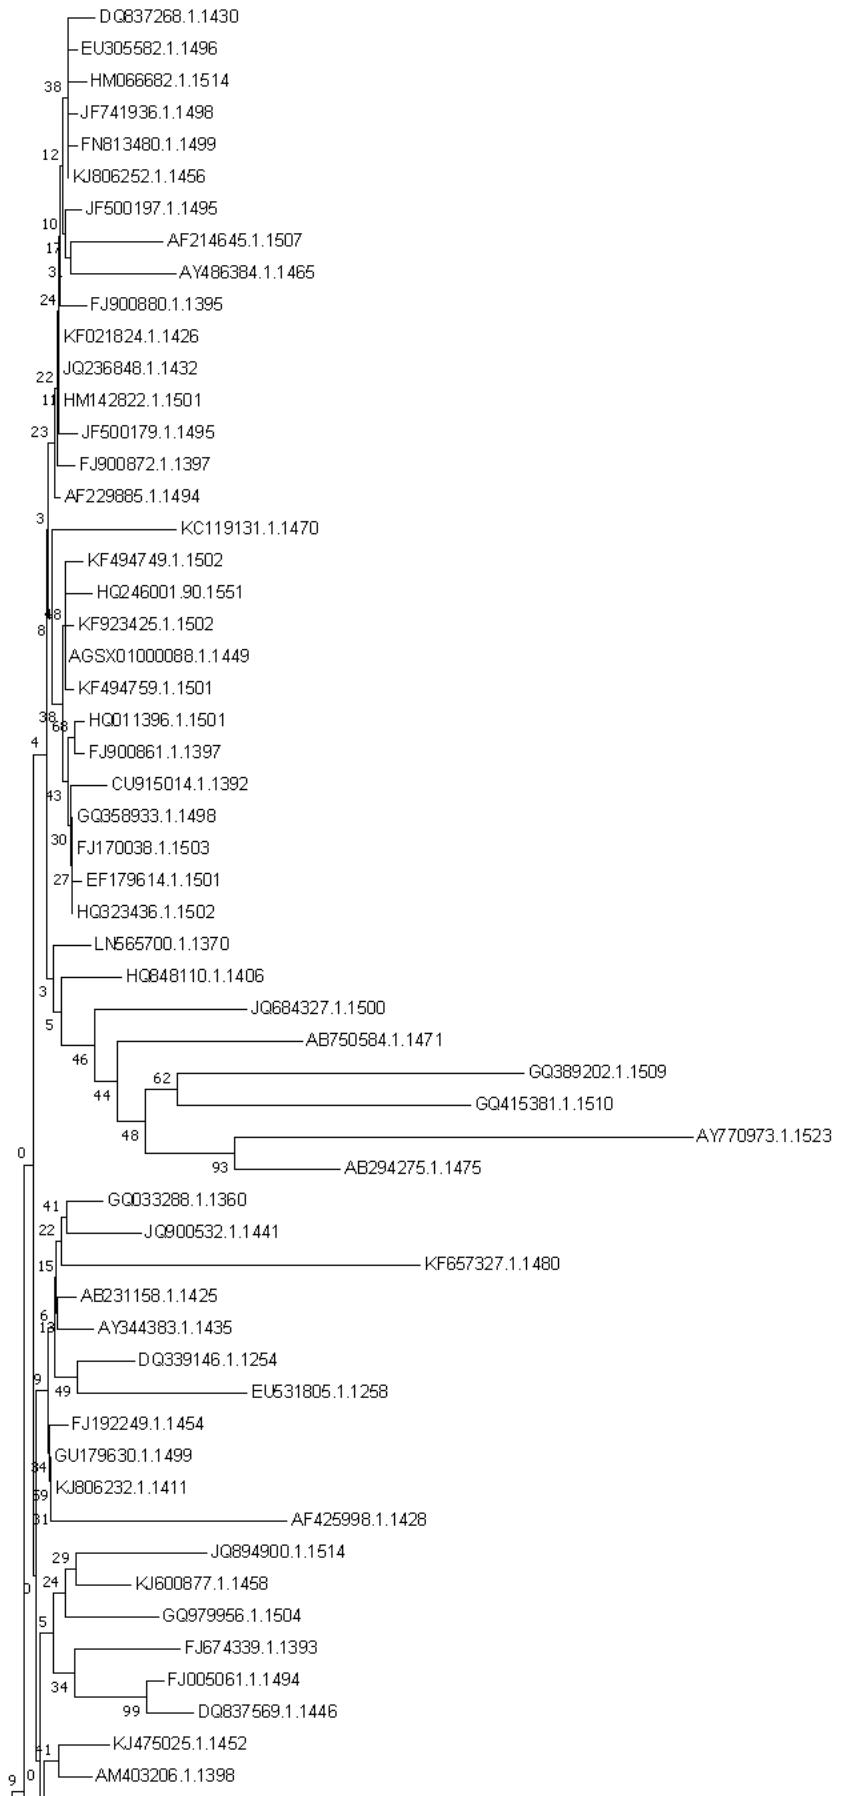

40 **Supplementary Figure 1** – Distribution of samples in the final dataset across depth, colourised by
41 general location. Shapes indicate 16S rRNA gene region utilised for that study.

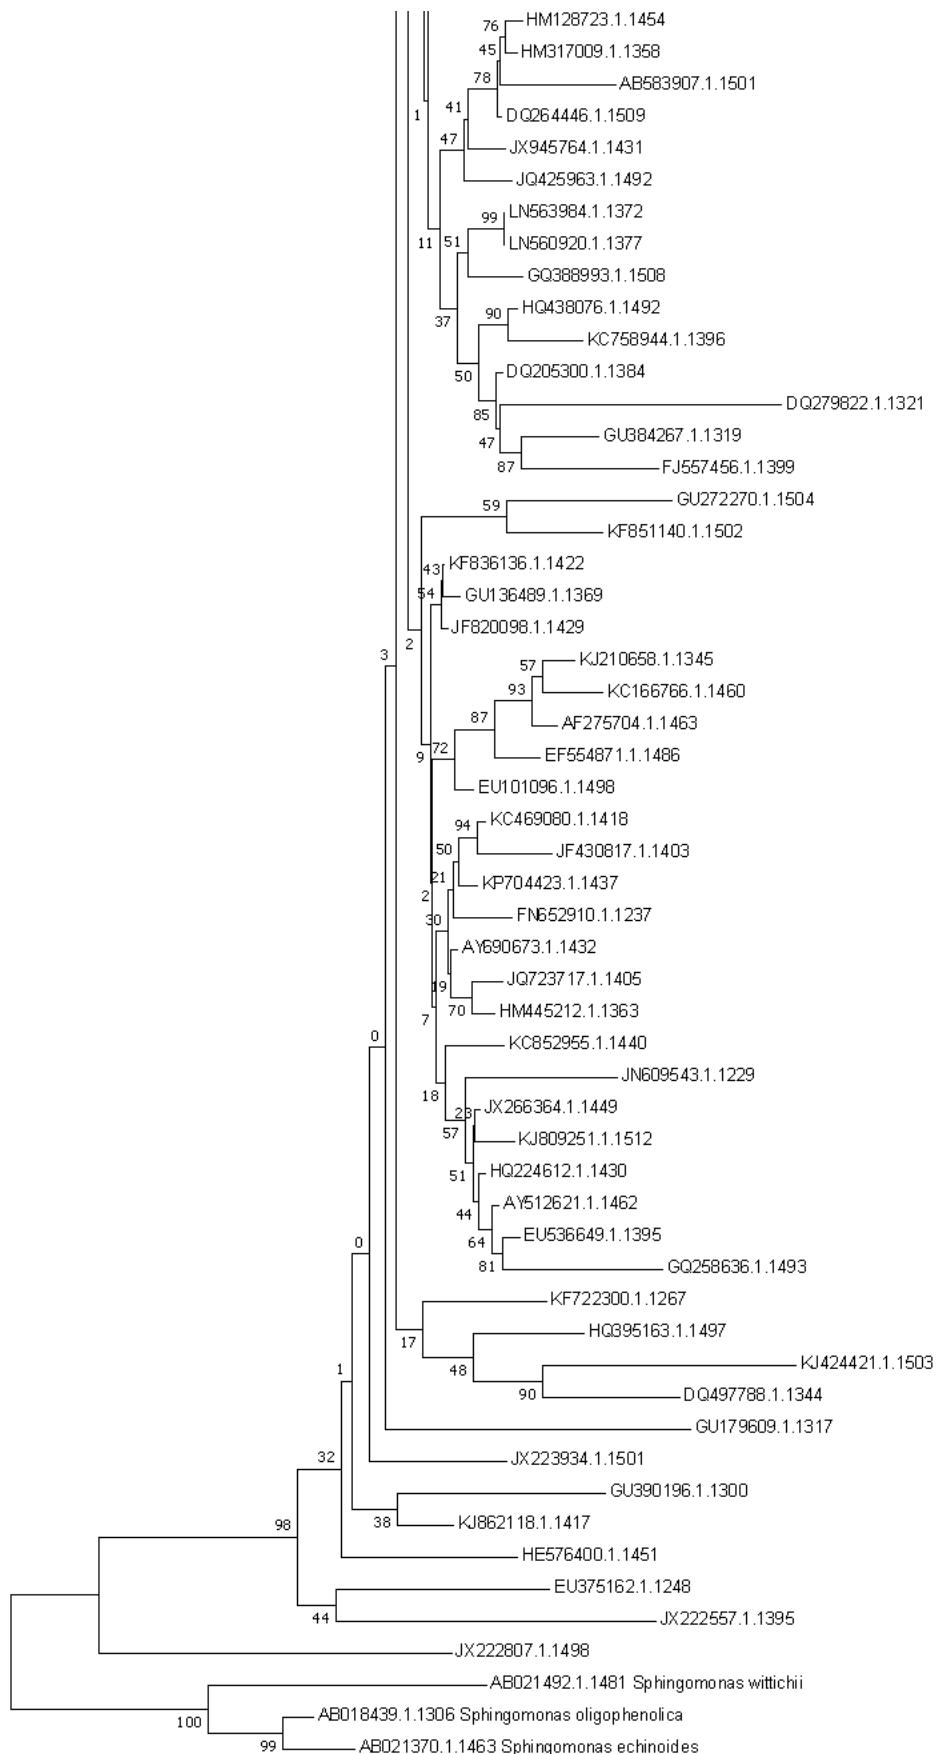

42

43

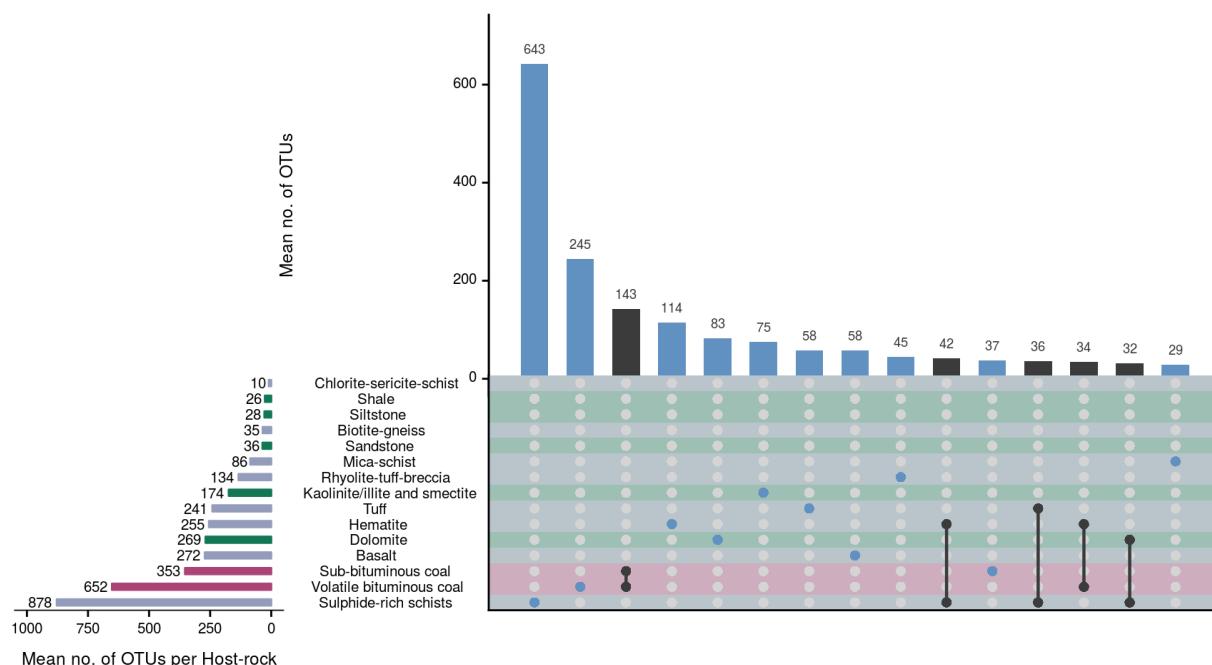

44 **Supplementary Figure 2** – Standard deviations in percentages for **Figure 1**. X-axis shows host-
45 rocks, y-axis depicts the main phyla and classes in the dataset. Grey cells depict non-applicable (NA)
46 standard deviations derived from small sample sizes.

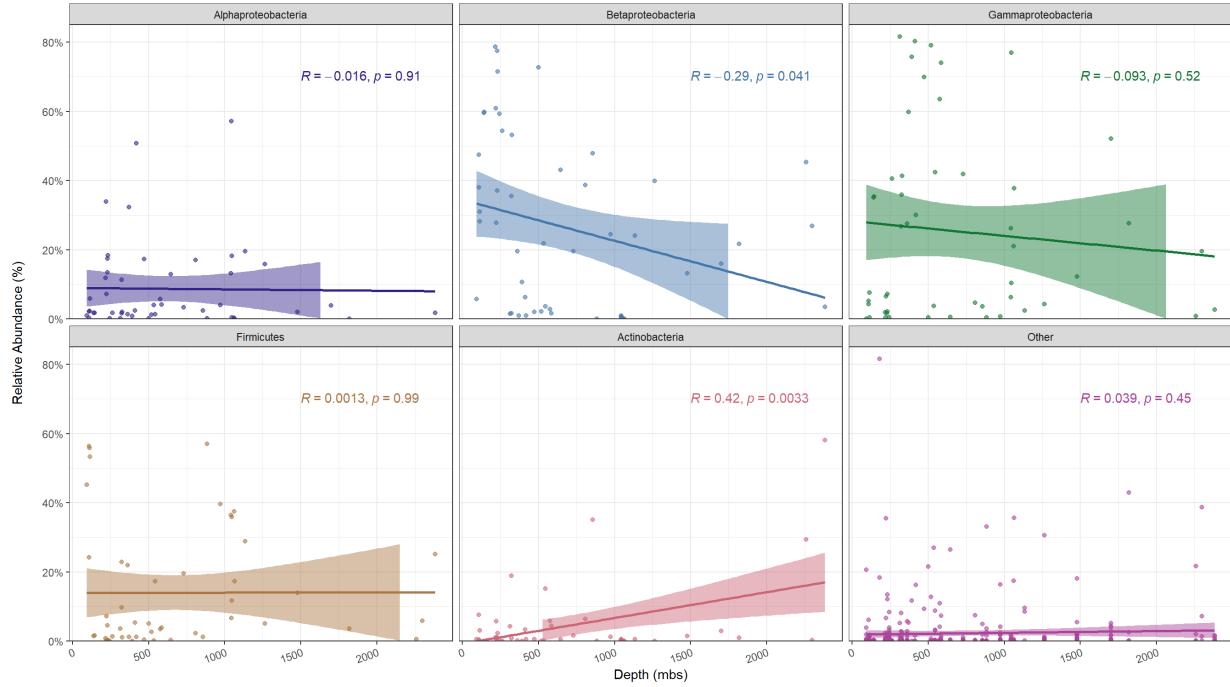

49 **Supplementary Figure 3** – Optimal Neighbor-Joining tree of representative sequences for
 50 *Pseudomonas* OTUs in the dataset following MUSCLE alignment. OTU IDs are shown in the end of
 51 each branch and outgroup sequences of genus *Sphingomonas* identified by their taxonomic affiliation.
 52 The percentage of bootstrap test replicates are shown next to tree branches and scale for MCL
 53 evolutionary distances is shown in the bottom.

54

55
 56 **Supplementary Figure 4** - *UpsetR* plot of mean numbers of OTU interactions among rock types.
 57 Only interactions involving 25 or more OTUs on average are shown. Coloured matrix rows
 58 correspond to host-rocks, and are coloured according to rock type: blue for crystalline, green for
 59 sedimentary rocks and pink for coals, which were highlighted due to their higher sample contribution
 60 to the dataset. Columns depict OTU interactions: blue dots mark independent (mean number of non-
 61 shared OTUs) interactions and black dots connected by black lines mark shared OTUs between two
 62 or more host-rocks. Shared interactions are composed of only the host-rocks marked by dots. Vertical
 63 bars on top of the coloured matrix correspond to mean OTU numbers present in the described
 64 interactions and are coloured black or blue if depicting shared or non-shared interactions,
 65 respectively. Horizontal bars by the left of the coloured matrix depict mean total numbers of OTUs
 66 per host-rock.

67

68 **Supplementary Figure 5** - Correlations between relative abundance of OTUs (%, y-axis) associated
 69 to the most abundant taxonomic groups across the dataset and depth (meters below surface, x-axis).
 70 Regression lines follow the linear model and shading around lines corresponds to the 95% confidence
 71 interval. Annotations in plot facets indicate the associated Pearson correlation coefficient, its
 72 corresponding p-value and the fitted linear model equation. Each point represents an OTU associated
 73 to the taxonomic group in each facet at a certain depth - a same OTU may be depicted more than one
 74 time.

75

76 **Supplementary Tables**

77
78 **Supplementary Table 1** – Numbers of reads following default and the stricter filtering (see
